Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Process state verification - mesh-58

The selected node was reviewed after the operational step to confirm the state of the relevant process family.

Server	Role	Address	Service	Operation
mesh-58	relay host	198.51.100.58	springboot-web	verify process state

Evidence capture 1: synthetic proc view for mesh-58.

The process matrix confirms the selected service family reached the expected post-action state.

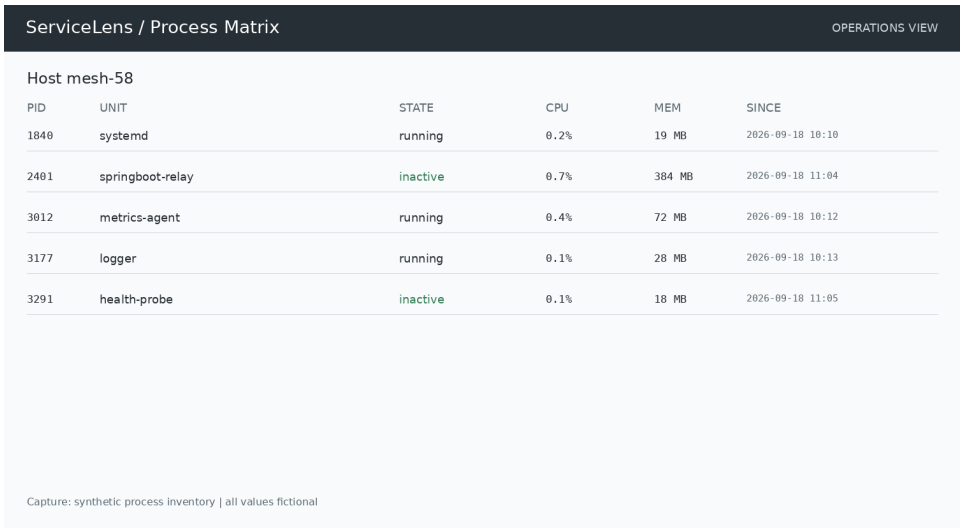

Step	Action	Result	Duration
1	prepare control window	accepted	00:00:12
2	verify process state	complete	00:01:14
3	record verification	matched	00:00:08

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Process state verification - mesh-58

A process inventory was captured after the maintenance action to verify that the expected service state was reached.

Server	Role	Address	Service	Operation
mesh-58	relay host	198.51.100.58	springboot-relay	verify process state

Evidence capture 2: synthetic proc view for mesh-58.

The process matrix confirms the selected service family reached the expected post-action state.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

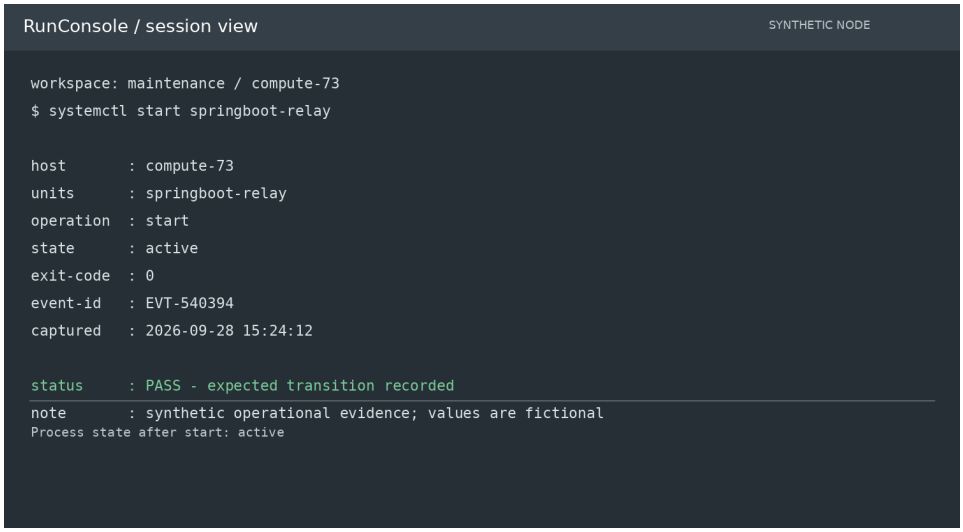

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Service start evidence - compute-73

The selected runtime was started as part of the recorded maintenance action; the resulting state is shown below.

Server	Role	Address	Service	Operation
compute-73	compute worker	192.0.2.73	springboot-relay	start

Evidence capture 1: synthetic start view for compute-73.

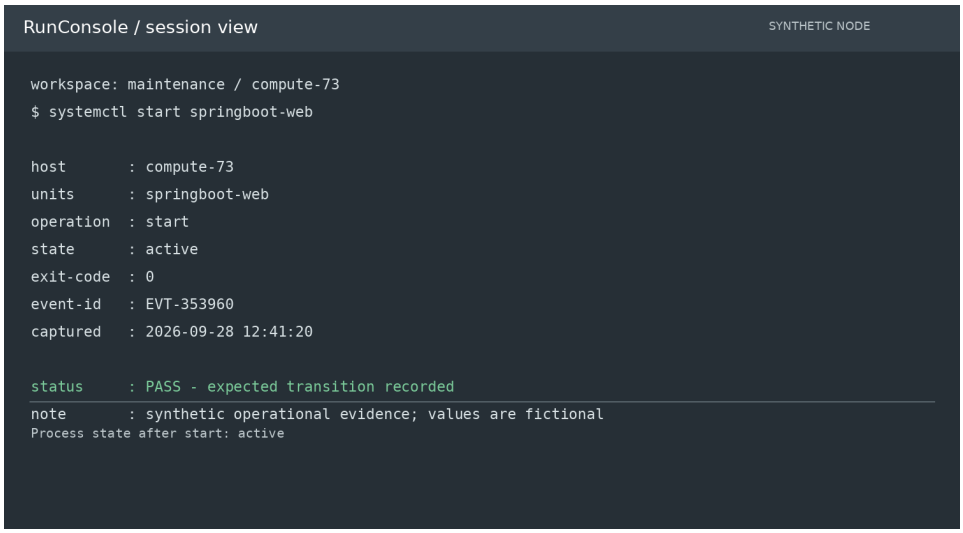

The runtime process is shown in the expected active state after the start action.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Service start evidence - compute-73

The service transition was captured after the selected unit entered the maintenance window.

Server	Role	Address	Service	Operation
compute-73	compute worker	192.0.2.73	springboot-web	start

Evidence capture 2: synthetic start view for compute-73.

The runtime process is shown in the expected active state after the start action.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

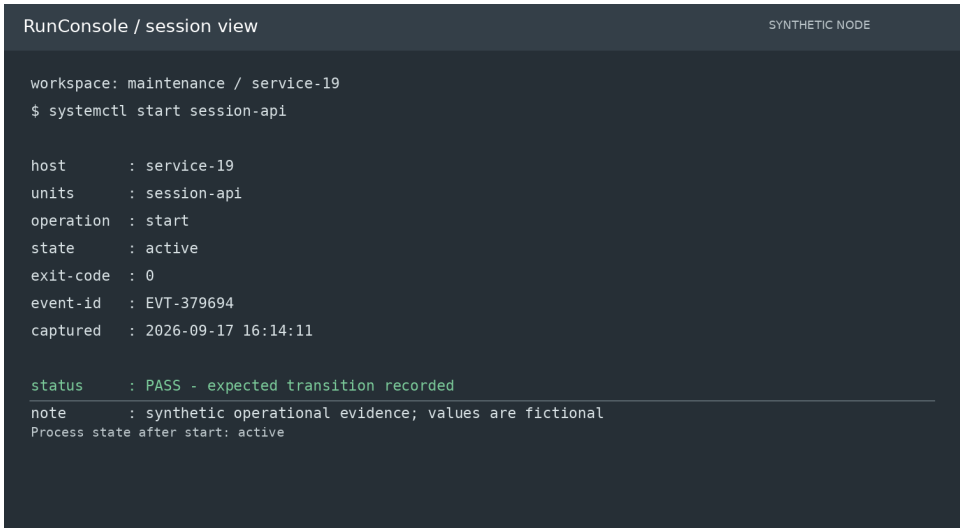

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Service start evidence - service-19

The service transition was captured after the selected unit entered the maintenance window.

Server	Role	Address	Service	Operation
service-19	service host	198.51.100.19	session-api	start

Evidence capture 1: synthetic start view for service-19.

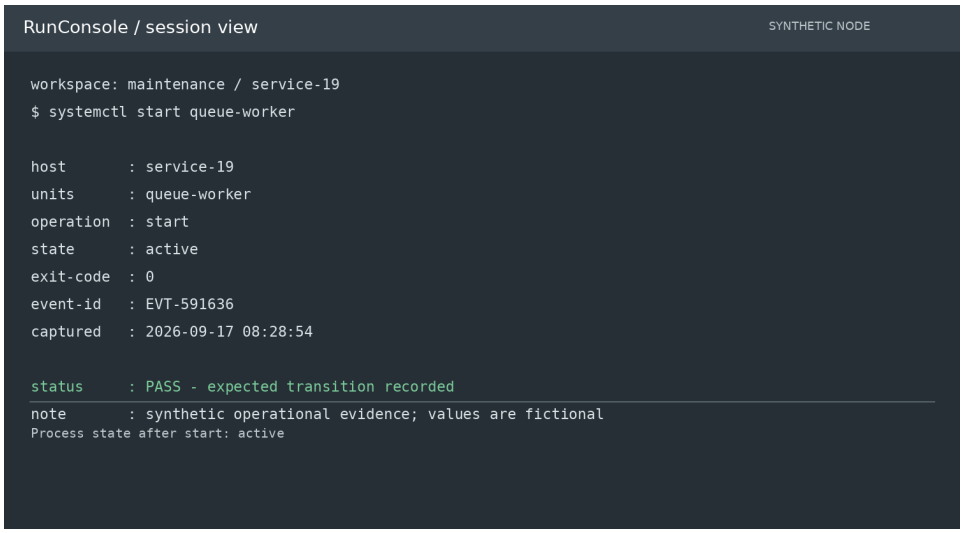

The runtime process is shown in the expected active state after the start action.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Service start evidence - service-19

The selected runtime was started as part of the recorded maintenance action; the resulting state is shown below.

Server	Role	Address	Service	Operation
service-19	service host	198.51.100.19	queue-worker	start

Evidence capture 2: synthetic start view for service-19.

The runtime process is shown in the expected active state after the start action.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

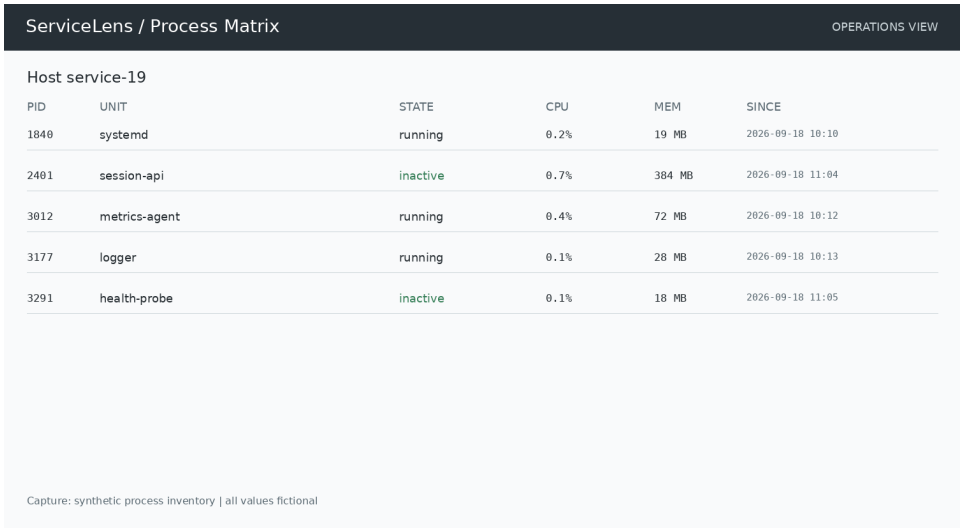

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Process state verification - service-19

A process inventory was captured after the maintenance action to verify that the expected service state was reached.

Server	Role	Address	Service	Operation
service-19	service host	198.51.100.19	session-api	verify process state

Evidence capture 1: synthetic proc view for service-19.

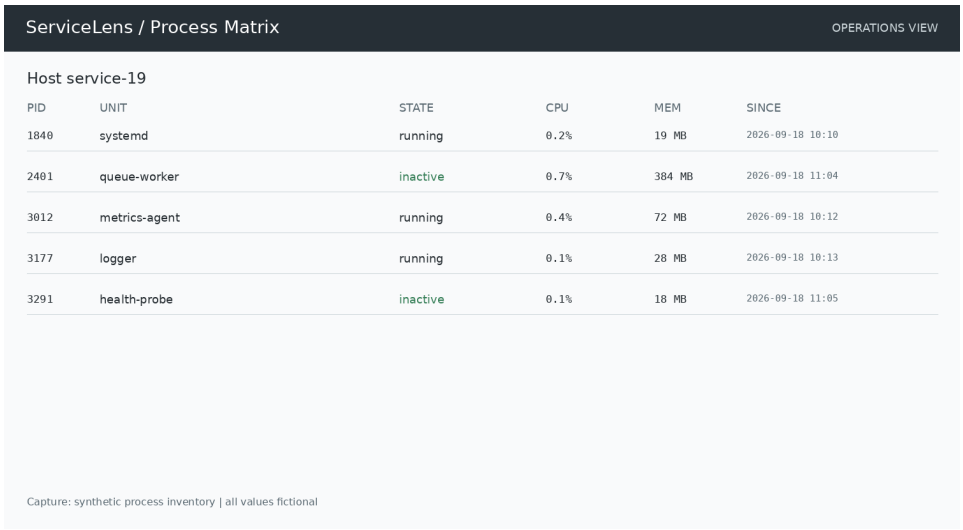

The process matrix confirms the selected service family reached the expected post-action state.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Process state verification - service-19

The selected node was reviewed after the operational step to confirm the state of the relevant process family.

Server	Role	Address	Service	Operation
service-19	service host	198.51.100.19	queue-worker	verify process state

Evidence capture 2: synthetic proc view for service-19.

The process matrix confirms the selected service family reached the expected post-action state.

Step	Action	Result	Duration
1	prepare control window	accepted	00:00:12
2	verify process state	complete	00:01:14
3	record verification	matched	00:00:08

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

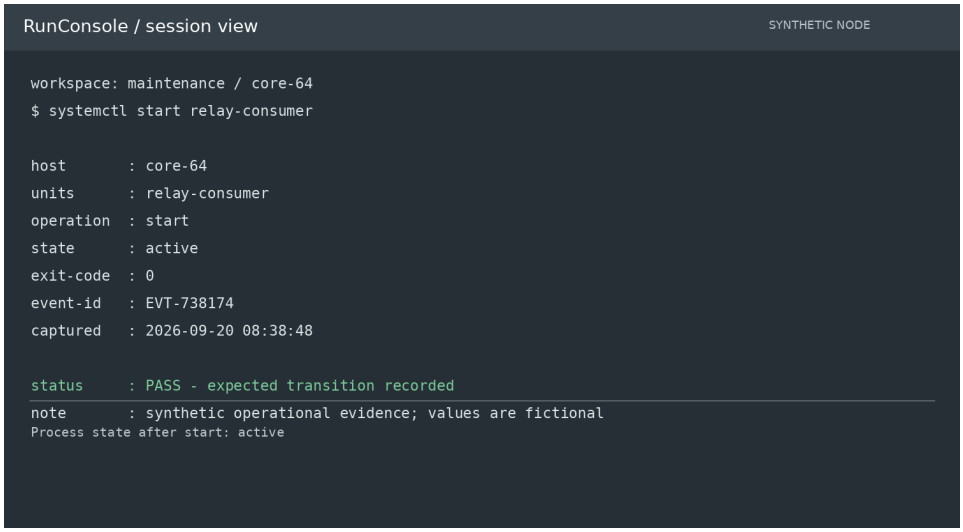

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Service start evidence - core-64

The service transition was captured after the selected unit entered the maintenance window.

Server	Role	Address	Service	Operation
core-64	core service host	203.0.113.64	relay-consumer	start

Evidence capture 1: synthetic start view for core-64.

The runtime process is shown in the expected active state after the start action.

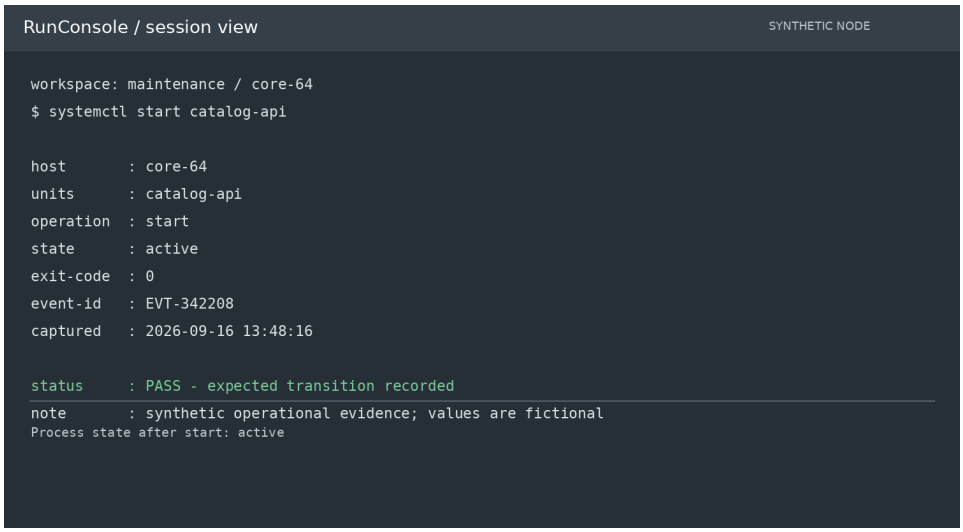

Step	Action	Result	Duration
1	prepare control window	accepted	00:00:12
2	start	complete	00:01:14
3	record verification	matched	00:00:08

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Service start evidence - core-64

The selected runtime was started as part of the recorded maintenance action; the resulting state is shown below.

Server	Role	Address	Service	Operation
core-64	core service host	203.0.113.64	catalog-api	start

Evidence capture 2: synthetic start view for core-64.

The runtime process is shown in the expected active state after the start action.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

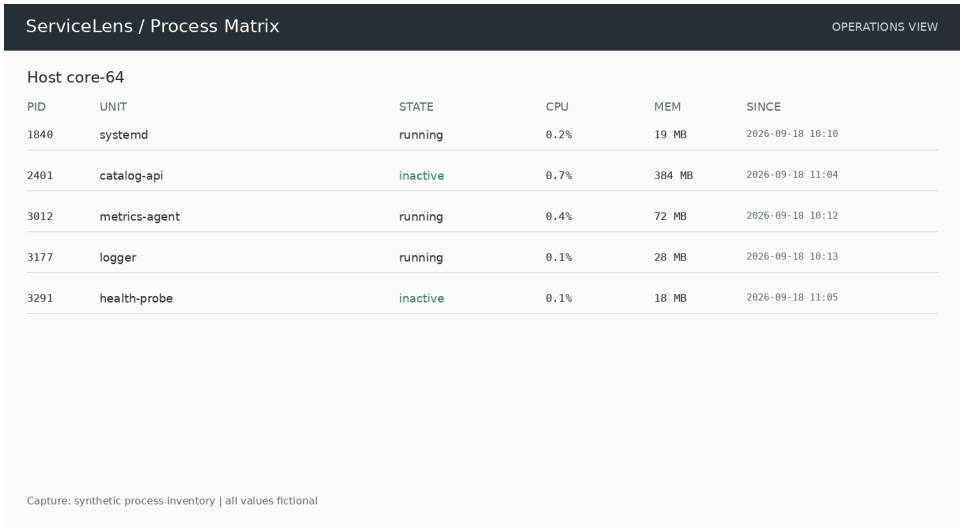

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Process state verification - core-64

A process inventory was captured after the maintenance action to verify that the expected service state was reached.

Server	Role	Address	Service	Operation
core-64	core service host	203.0.113.64	catalog-api	verify process state

Evidence capture 1: synthetic proc view for core-64.

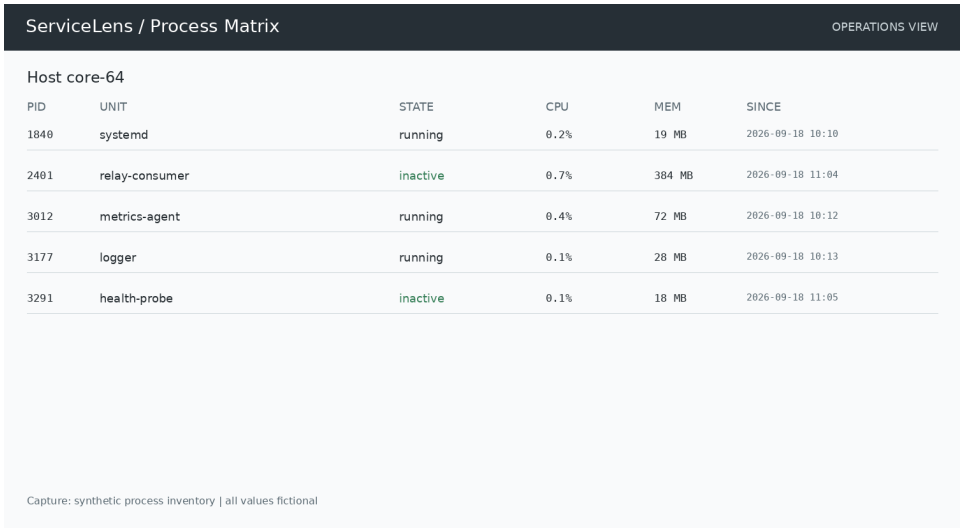

The process matrix confirms the selected service family reached the expected post-action state.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Process state verification - core-64

The selected node was reviewed after the operational step to confirm the state of the relevant process family.

Server	Role	Address	Service	Operation
core-64	core service host	203.0.113.64	relay-consumer	verify process state

Evidence capture 2: synthetic proc view for core-64.

The process matrix confirms the selected service family reached the expected post-action state.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

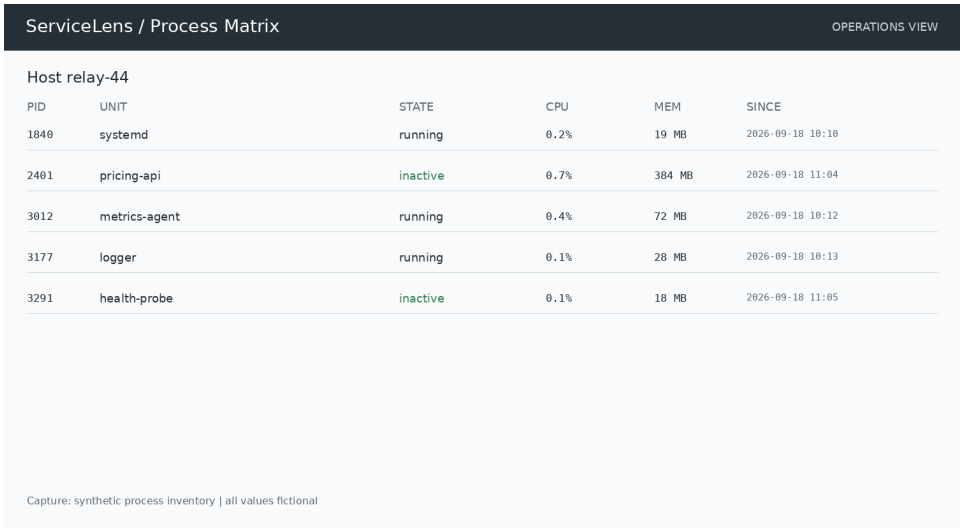

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Process state verification - relay-44

The selected node was reviewed after the operational step to confirm the state of the relevant process family.

Server	Role	Address	Service	Operation
relay-44	relay worker	198.51.100.44	pricing-api	verify process state

Evidence capture 1: synthetic proc view for relay-44.

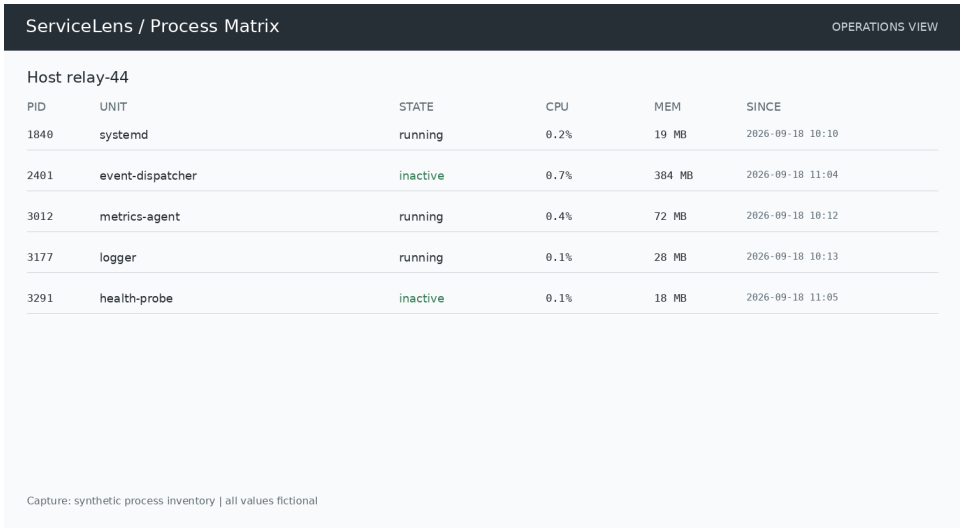

The process matrix confirms the selected service family reached the expected post-action state.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Process state verification - relay-44

A process inventory was captured after the maintenance action to verify that the expected service state was reached.

Server	Role	Address	Service	Operation
relay-44	relay worker	198.51.100.44	event-dispatcher	verify process state

Evidence capture 2: synthetic proc view for relay-44.

The process matrix confirms the selected service family reached the expected post-action state.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

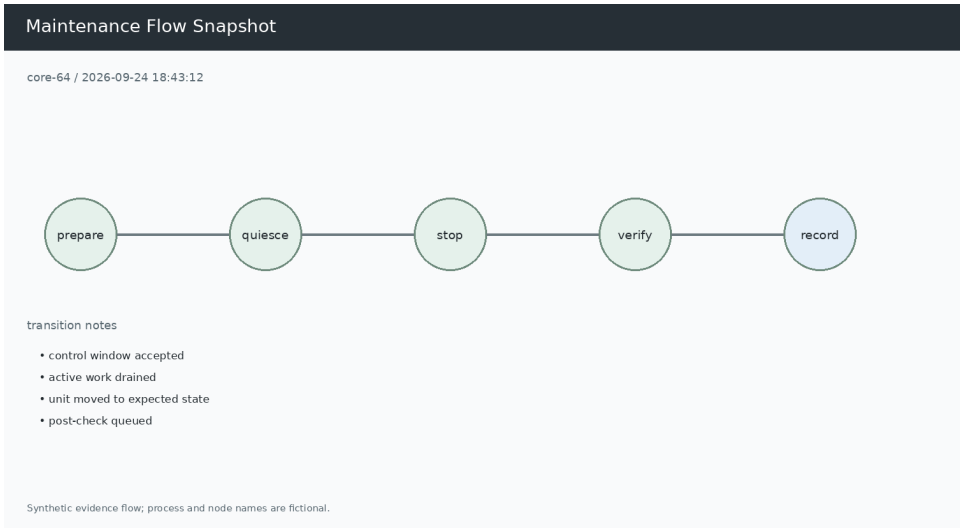

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Maintenance sequence evidence - core-64

The evidence below records the ordered control steps used for the selected node during the maintenance window.

Server	Role	Address	Service	Operation
core-64	core service host	203.0.113.64	relay-consumer	maintenance flow

Evidence capture 1: synthetic flow view for core-64.

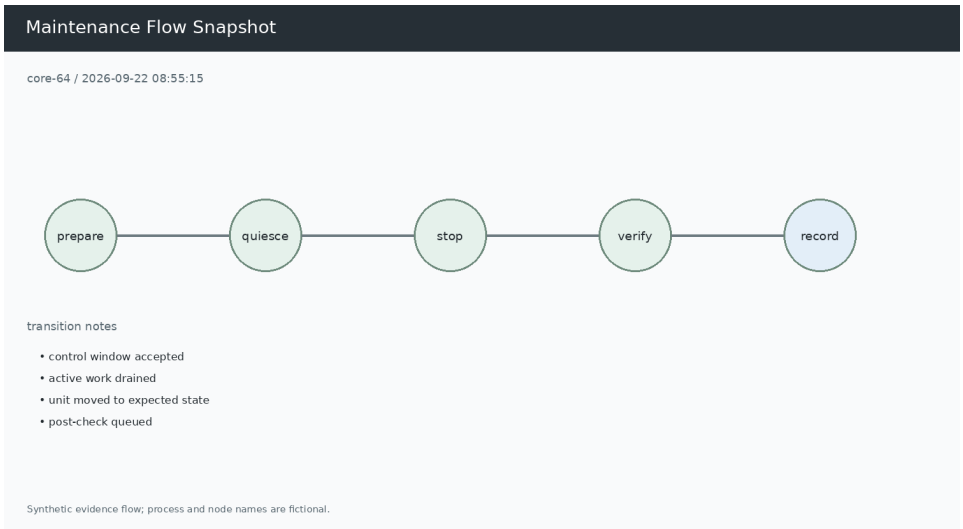

The sequence shows the expected transition and a completed post-action verification.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Maintenance sequence evidence - core-64

The maintenance sequence was captured from preparation through verification and record closure.

Server	Role	Address	Service	Operation
core-64	core service host	203.0.113.64	catalog-api	maintenance flow

Evidence capture 2: synthetic flow view for core-64.

The sequence shows the expected transition and a completed post-action verification.

Step	Action	Result	Duration
1	prepare control window	accepted	00:00:12
2	maintenance flow	complete	00:01:14
3	record verification	matched	00:00:08

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

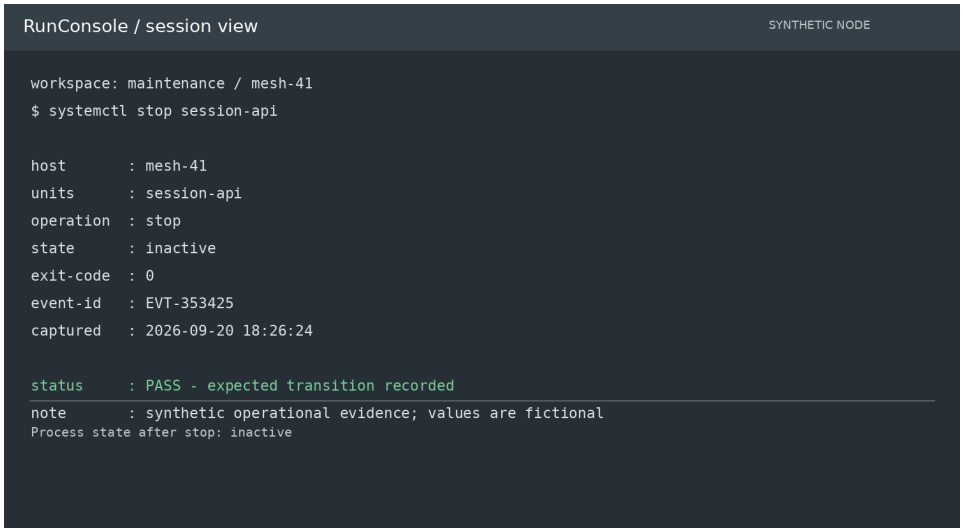

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Service stop evidence - mesh-41

The selected runtime was stopped as part of the controlled maintenance action before post-action verification.

Server	Role	Address	Service	Operation
mesh-41	edge coordinator	192.0.2.41	session-api	stop

Evidence capture 1: synthetic terminal view for mesh-41.

The verification output shows the runtime process in the expected inactive state after the stop action.

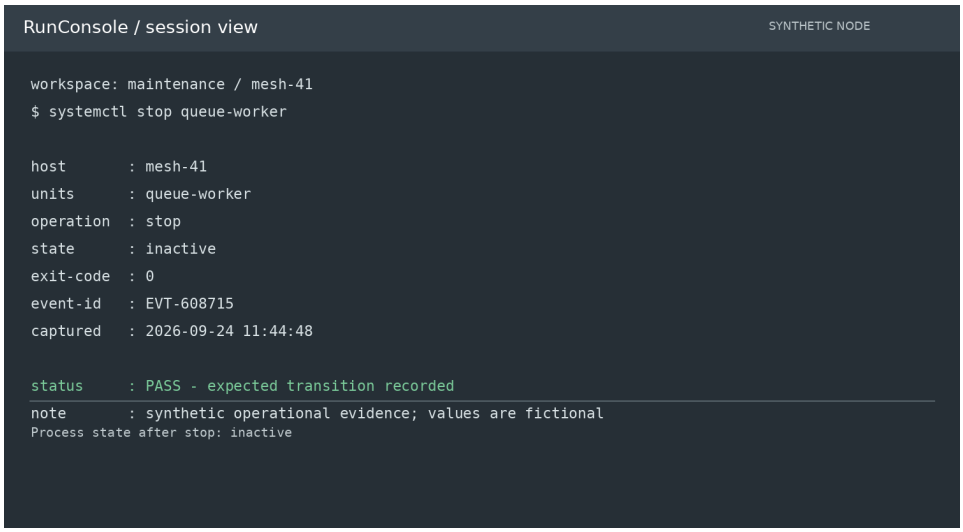

Step	Action	Result	Duration
1	prepare control window	accepted	00:00:12
2	stop	complete	00:01:14
3	record verification	matched	00:00:08

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Service stop evidence - mesh-41

The node was moved through the planned stop sequence and the final process state was captured below.

Server	Role	Address	Service	Operation
mesh-41	edge coordinator	192.0.2.41	queue-worker	stop

Evidence capture 2: synthetic terminal view for mesh-41.

The verification output shows the runtime process in the expected inactive state after the stop action.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

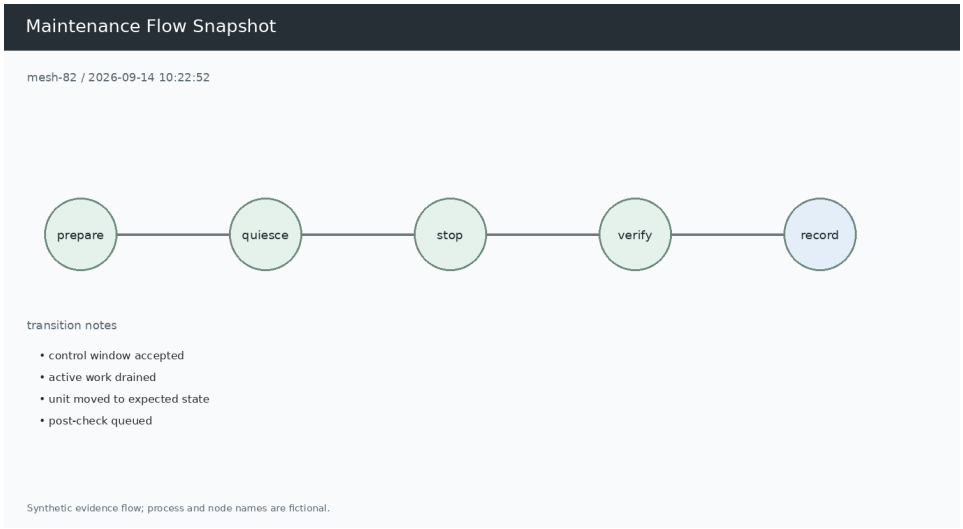

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Maintenance sequence evidence - mesh-82

The evidence below records the ordered control steps used for the selected node during the maintenance window.

Server	Role	Address	Service	Operation
mesh-82	mesh worker	192.0.2.82	catalog-api	maintenance flow

Evidence capture 1: synthetic flow view for mesh-82.

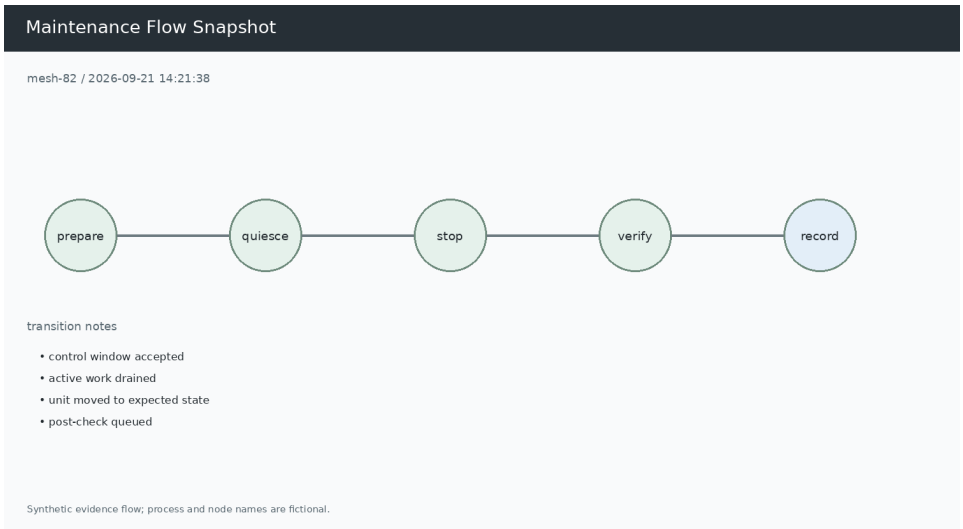

The sequence shows the expected transition and a completed post-action verification.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Maintenance sequence evidence - mesh-82

The maintenance sequence was captured from preparation through verification and record closure.

Server	Role	Address	Service	Operation
mesh-82	mesh worker	192.0.2.82	relay-consumer	maintenance flow

Evidence capture 2: synthetic flow view for mesh-82.

The sequence shows the expected transition and a completed post-action verification.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.
