Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Service stop evidence - mesh-58

The selected runtime was stopped as part of the controlled maintenance action before post-action verification.

Server	Role	Address	Service	Operation
mesh-58	relay host	198.51.100.58	springboot-relay	stop

Evidence capture 1: synthetic terminal view for mesh-58.

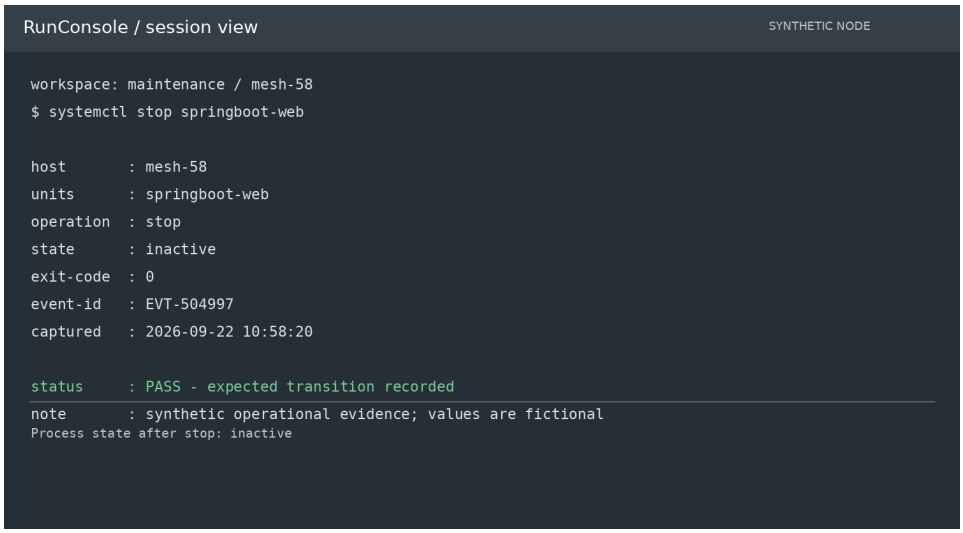

The verification output shows the runtime process in the expected inactive state after the stop action.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Service stop evidence - mesh-58

The node was moved through the planned stop sequence and the final process state was captured below.

Server	Role	Address	Service	Operation
mesh-58	relay host	198.51.100.58	springboot-web	stop

Evidence capture 2: synthetic terminal view for mesh-58.

The verification output shows the runtime process in the expected inactive state after the stop action.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

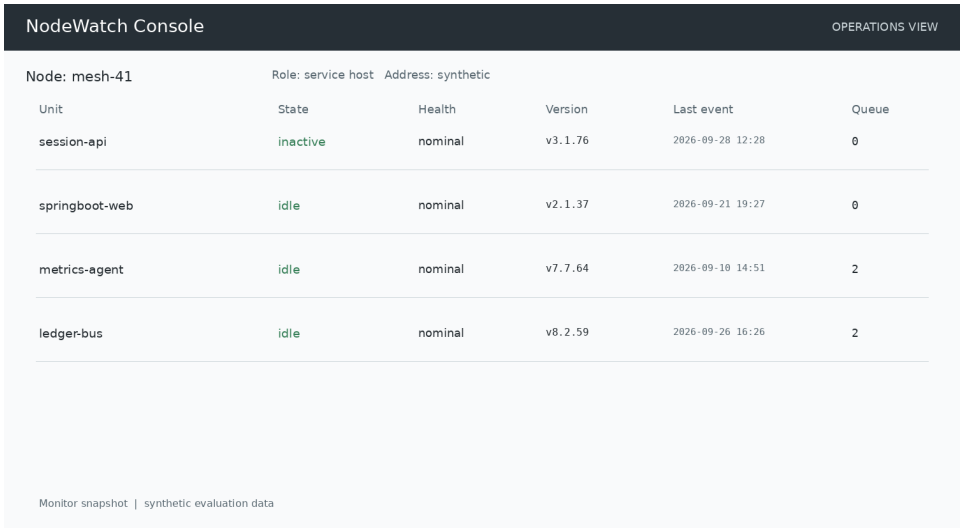

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Service health snapshot - mesh-41

The monitoring view below provides the supporting health evidence collected after the operational step.

Server	Role	Address	Service	Operation
mesh-41	edge coordinator	192.0.2.41	session-api	health review

Evidence capture 1: synthetic dash view for mesh-41.

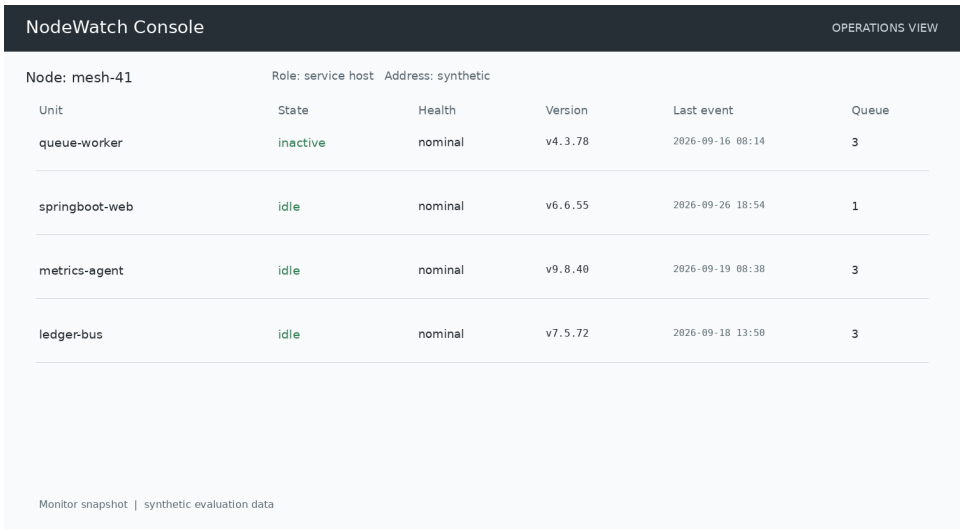

The monitoring snapshot records a stable node condition with the selected service in the expected state.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Service health snapshot - mesh-41

A post-action monitoring snapshot was captured to compare runtime state, node health, and queue condition.

Server	Role	Address	Service	Operation
mesh-41	edge coordinator	192.0.2.41	queue-worker	health review

Evidence capture 2: synthetic dash view for mesh-41.

The monitoring snapshot records a stable node condition with the selected service in the expected state.

Step	Action	Result	Duration
1	prepare control window	accepted	00:00:12
2	health review	complete	00:01:14
3	record verification	matched	00:00:08

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

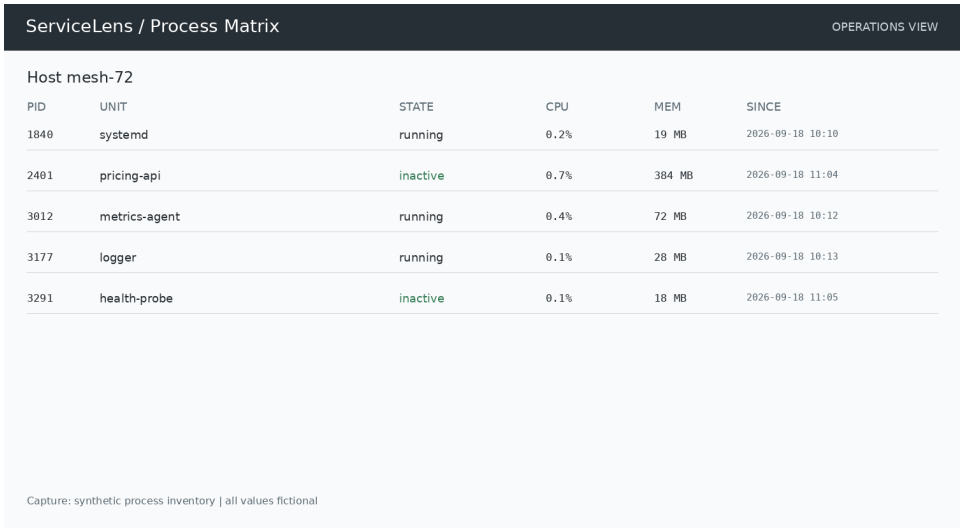

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Process state verification - mesh-72

The selected node was reviewed after the operational step to confirm the state of the relevant process family.

Server	Role	Address	Service	Operation
mesh-72	mesh worker	192.0.2.72	pricing-api	verify process state

Evidence capture 1: synthetic proc view for mesh-72.

The process matrix confirms the selected service family reached the expected post-action state.

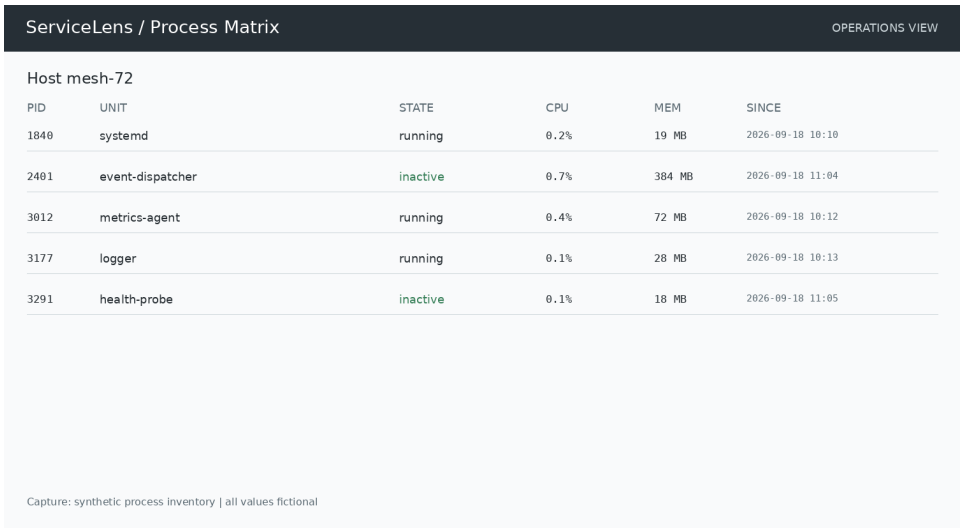

Step	Action	Result	Duration
1	prepare control window	accepted	00:00:12
2	verify process state	complete	00:01:14
3	record verification	matched	00:00:08

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Process state verification - mesh-72

A process inventory was captured after the maintenance action to verify that the expected service state was reached.

Server	Role	Address	Service	Operation
mesh-72	mesh worker	192.0.2.72	event-dispatcher	verify process state

Evidence capture 2: synthetic proc view for mesh-72.

The process matrix confirms the selected service family reached the expected post-action state.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Service start evidence - mesh-41

The selected runtime was started as part of the recorded maintenance action; the resulting state is shown below.

Server	Role	Address	Service	Operation
mesh-41	edge coordinator	192.0.2.41	queue-worker	start

Evidence capture 1: synthetic start view for mesh-41.

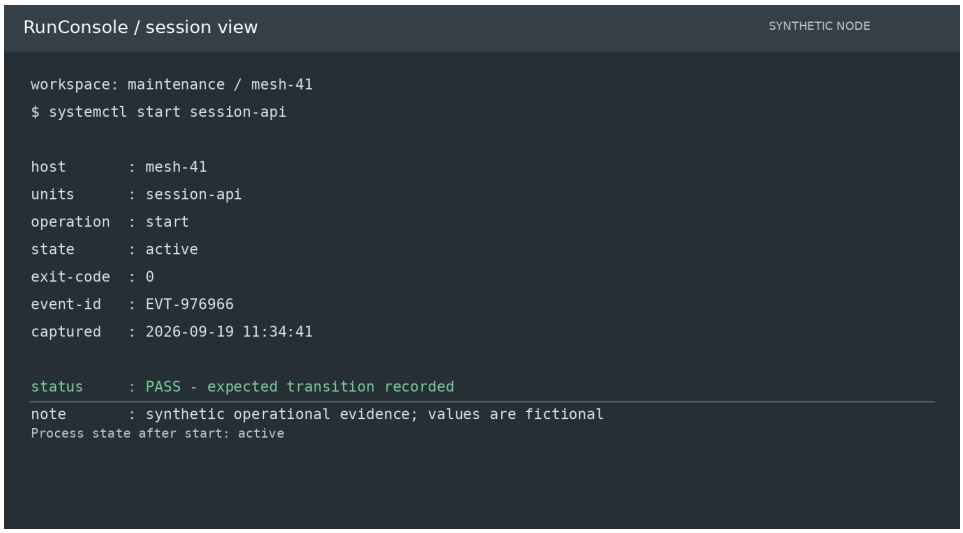

The runtime process is shown in the expected active state after the start action.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Service start evidence - mesh-41

The service transition was captured after the selected unit entered the maintenance window.

Server	Role	Address	Service	Operation
mesh-41	edge coordinator	192.0.2.41	session-api	start

Evidence capture 2: synthetic start view for mesh-41.

The runtime process is shown in the expected active state after the start action.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

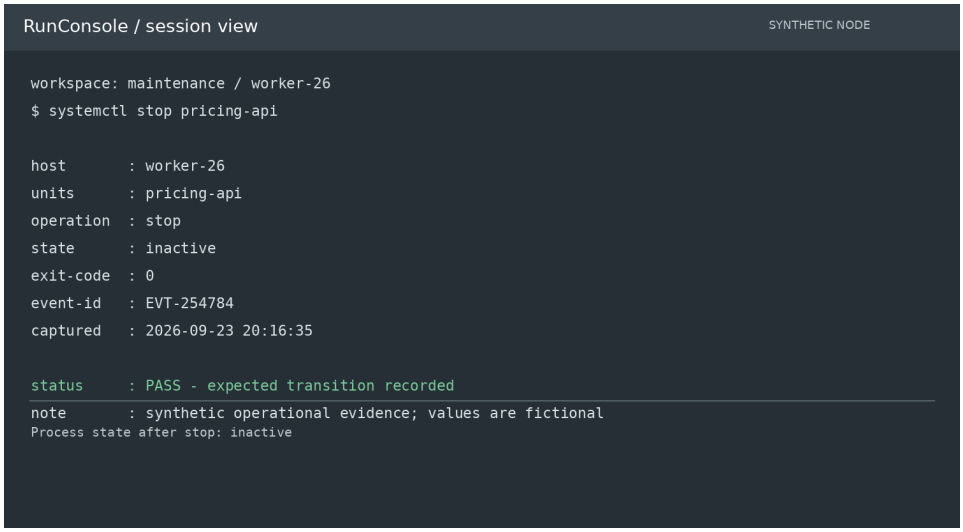

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Service stop evidence - worker-26

The selected runtime was stopped as part of the controlled maintenance action before post-action verification.

Server	Role	Address	Service	Operation
worker-26	background worker	198.51.100.26	pricing-api	stop

Evidence capture 1: synthetic terminal view for worker-26.

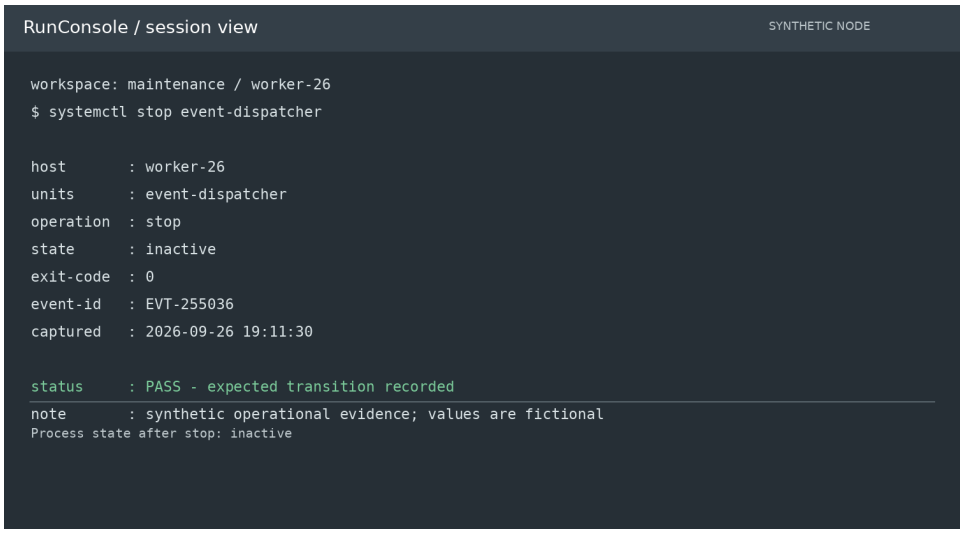

The verification output shows the runtime process in the expected inactive state after the stop action.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Service stop evidence - worker-26

The node was moved through the planned stop sequence and the final process state was captured below.

Server	Role	Address	Service	Operation
worker-26	background worker	198.51.100.26	event-dispatcher	stop

Evidence capture 2: synthetic terminal view for worker-26.

The verification output shows the runtime process in the expected inactive state after the stop action.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

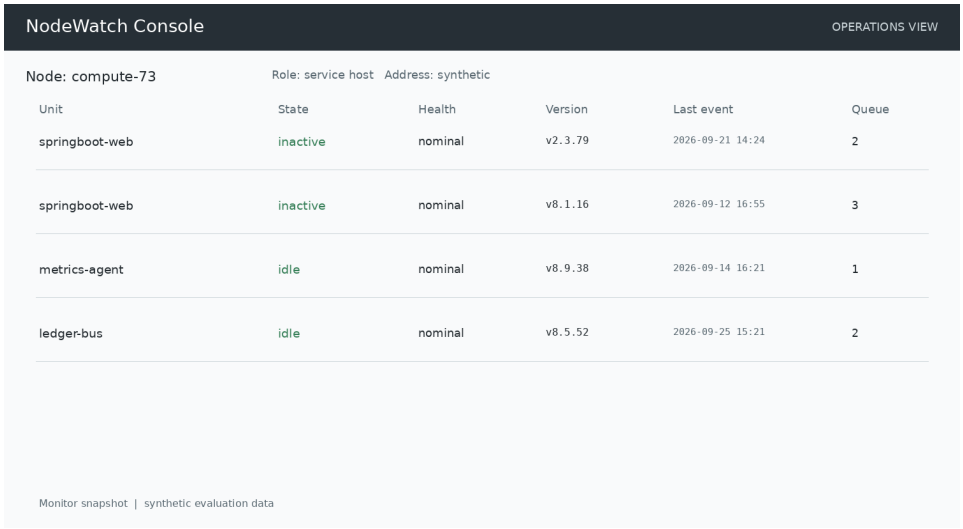

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Service health snapshot - compute-73

The monitoring view below provides the supporting health evidence collected after the operational step.

Server	Role	Address	Service	Operation
compute-73	compute worker	192.0.2.73	springboot-web	health review

Evidence capture 1: synthetic dash view for compute-73.

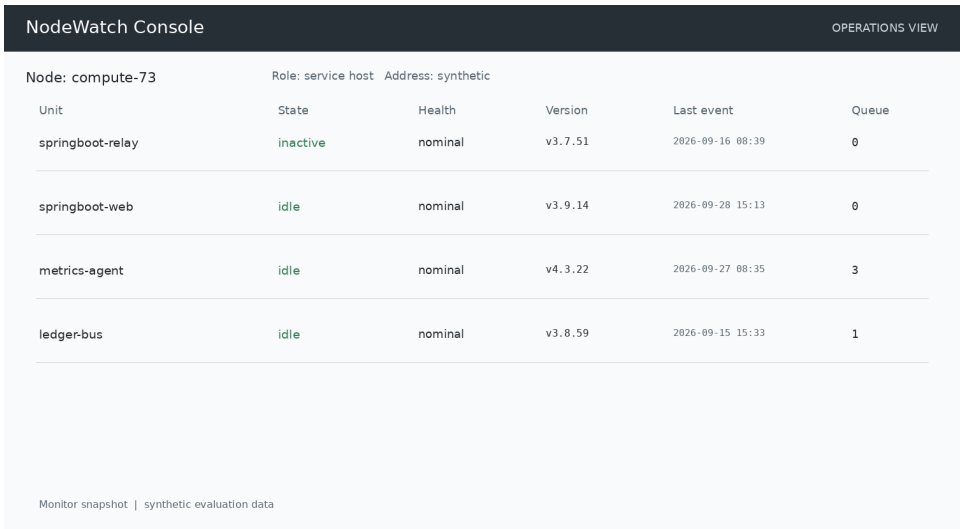

The monitoring snapshot records a stable node condition with the selected service in the expected state.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Service health snapshot - compute-73

A post-action monitoring snapshot was captured to compare runtime state, node health, and queue condition.

Server	Role	Address	Service	Operation
compute-73	compute worker	192.0.2.73	springboot-relay	health review

Evidence capture 2: synthetic dash view for compute-73.

The monitoring snapshot records a stable node condition with the selected service in the expected state.

Step	Action	Result	Duration
1	prepare control window	accepted	00:00:12
2	health review	complete	00:01:14
3	record verification	matched	00:00:08

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

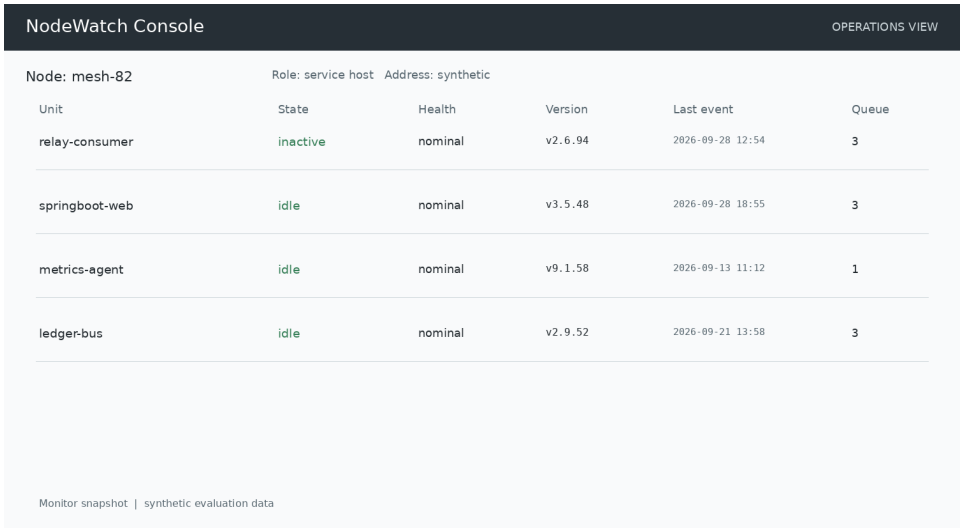

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Service health snapshot - mesh-82

A post-action monitoring snapshot was captured to compare runtime state, node health, and queue condition.

Server	Role	Address	Service	Operation
mesh-82	mesh worker	192.0.2.82	relay-consumer	health review

Evidence capture 1: synthetic dash view for mesh-82.

The monitoring snapshot records a stable node condition with the selected service in the expected state.

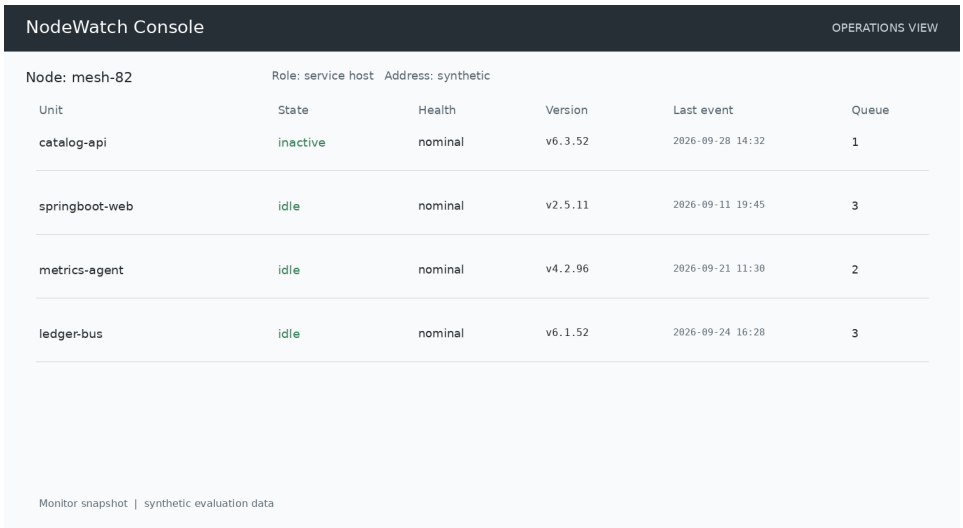

Step	Action	Result	Duration
1	prepare control window	accepted	00:00:12
2	health review	complete	00:01:14
3	record verification	matched	00:00:08

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Service health snapshot - mesh-82

The monitoring view below provides the supporting health evidence collected after the operational step.

Server	Role	Address	Service	Operation
mesh-82	mesh worker	192.0.2.82	catalog-api	health review

Evidence capture 2: synthetic dash view for mesh-82.

The monitoring snapshot records a stable node condition with the selected service in the expected state.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

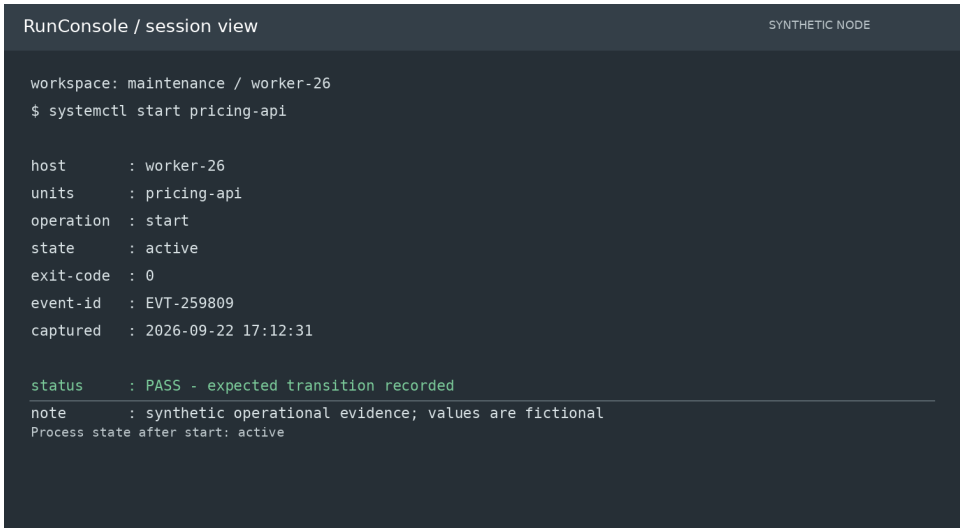

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Service start evidence - worker-26

The selected runtime was started as part of the recorded maintenance action; the resulting state is shown below.

Server	Role	Address	Service	Operation
worker-26	background worker	198.51.100.26	pricing-api	start

Evidence capture 1: synthetic start view for worker-26.

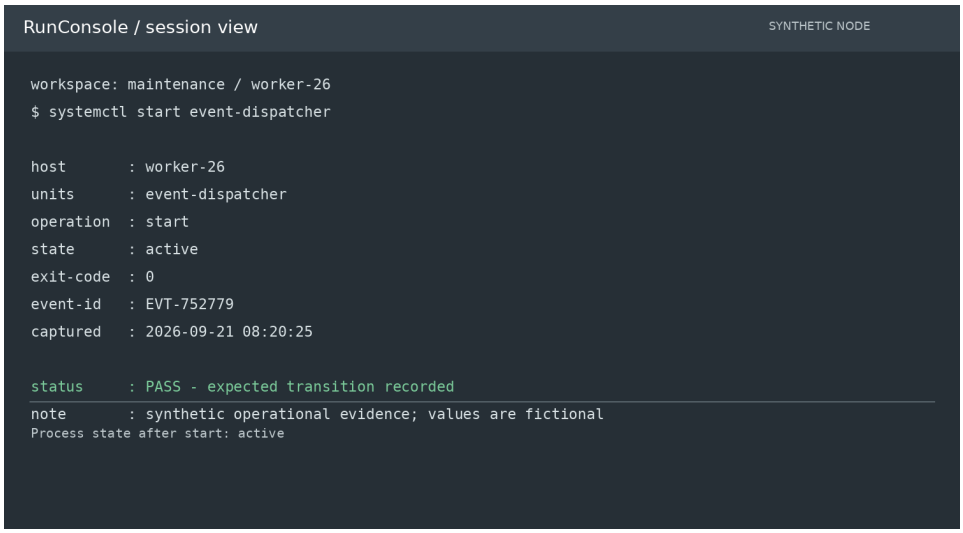

The runtime process is shown in the expected active state after the start action.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Service start evidence - worker-26

The service transition was captured after the selected unit entered the maintenance window.

Server	Role	Address	Service	Operation
worker-26	background worker	198.51.100.26	event-dispatcher	start

Evidence capture 2: synthetic start view for worker-26.

The runtime process is shown in the expected active state after the start action.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

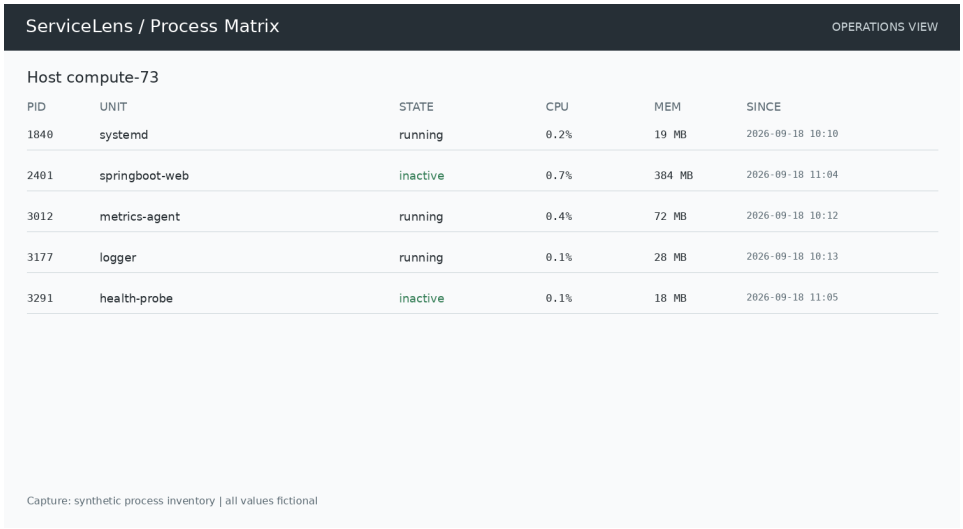

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Process state verification - compute-73

The selected node was reviewed after the operational step to confirm the state of the relevant process family.

Server	Role	Address	Service	Operation
compute-73	compute worker	192.0.2.73	springboot-web	verify process state

Evidence capture 1: synthetic proc view for compute-73.

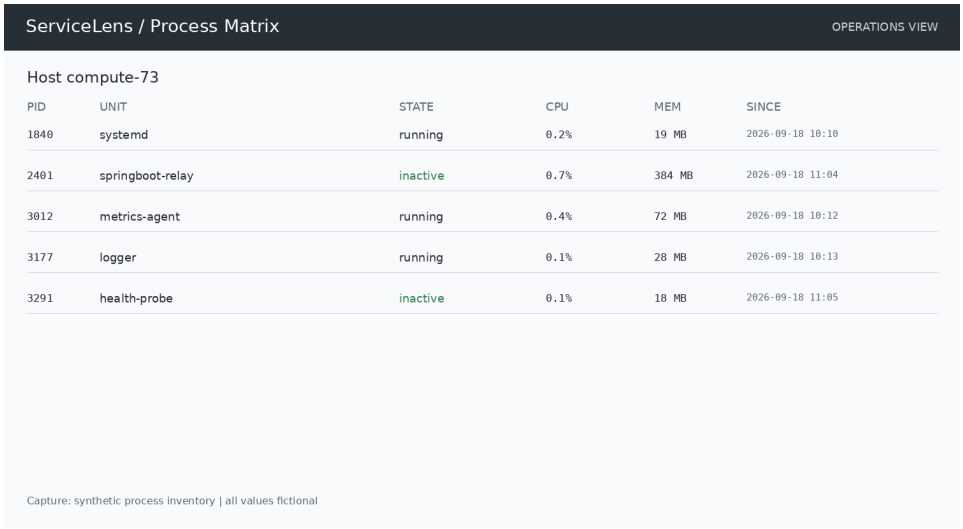

The process matrix confirms the selected service family reached the expected post-action state.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Process state verification - compute-73

A process inventory was captured after the maintenance action to verify that the expected service state was reached.

Server	Role	Address	Service	Operation
compute-73	compute worker	192.0.2.73	springboot-relay	verify process state

Evidence capture 2: synthetic proc view for compute-73.

The process matrix confirms the selected service family reached the expected post-action state.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

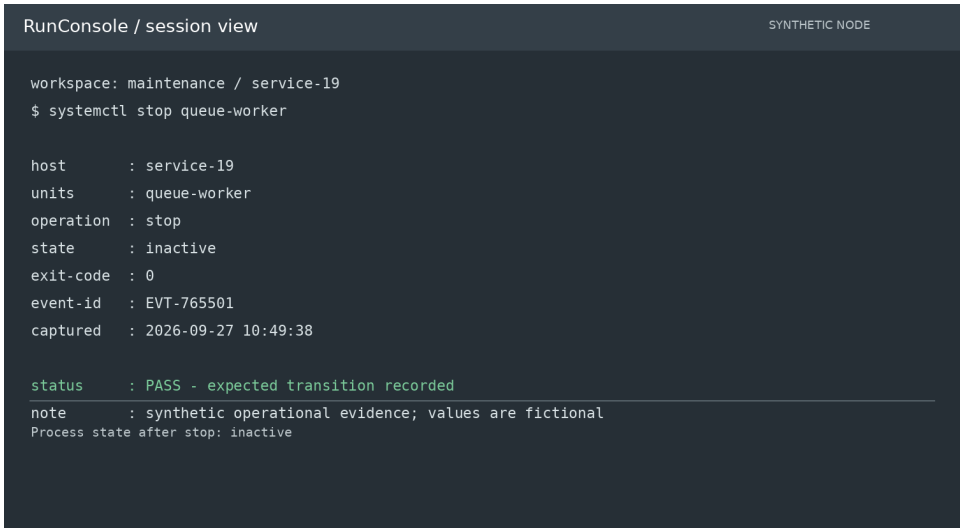

Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

Service stop evidence - service-19

The node was moved through the planned stop sequence and the final process state was captured below.

Server	Role	Address	Service	Operation
service-19	service host	198.51.100.19	queue-worker	stop

Evidence capture 1: synthetic terminal view for service-19.

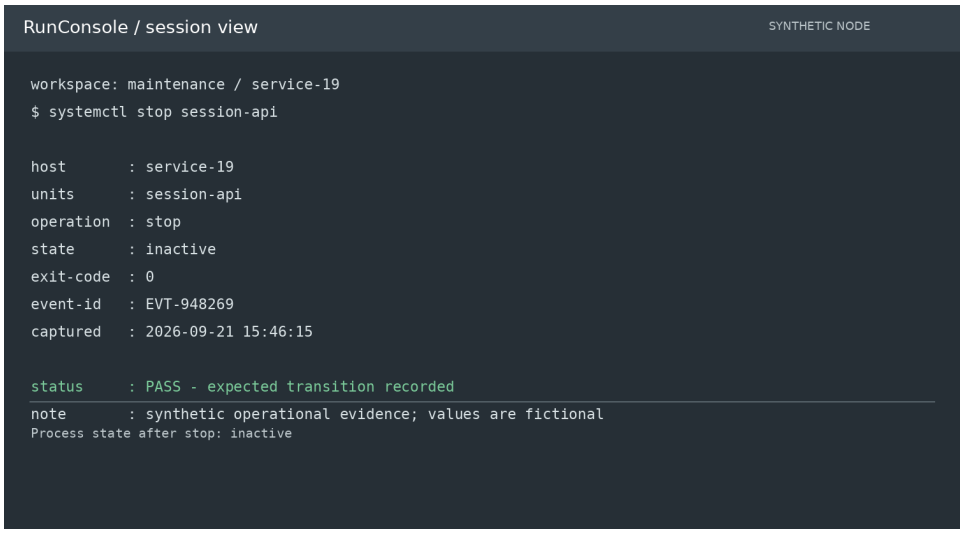

The verification output shows the runtime process in the expected inactive state after the stop action.

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.

Service stop evidence - service-19

The selected runtime was stopped as part of the controlled maintenance action before post-action verification.

Server	Role	Address	Service	Operation
service-19	service host	198.51.100.19	session-api	stop

Evidence capture 2: synthetic terminal view for service-19.

The verification output shows the runtime process in the expected inactive state after the stop action.

Step	Action	Result	Duration
1	prepare control window	accepted	00:00:12
2	stop	complete	00:01:14
3	record verification	matched	00:00:08

Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.
