# Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

## Service health snapshot - worker-26

A post-action monitoring snapshot was captured to compare runtime state, node health, and queue condition.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| worker-26 | background worker | 198.51.100.26 | pricing-api | health review |

*Evidence capture 1: synthetic dash view for worker-26.*

The monitoring snapshot records a stable node condition with the selected service in the expected state.

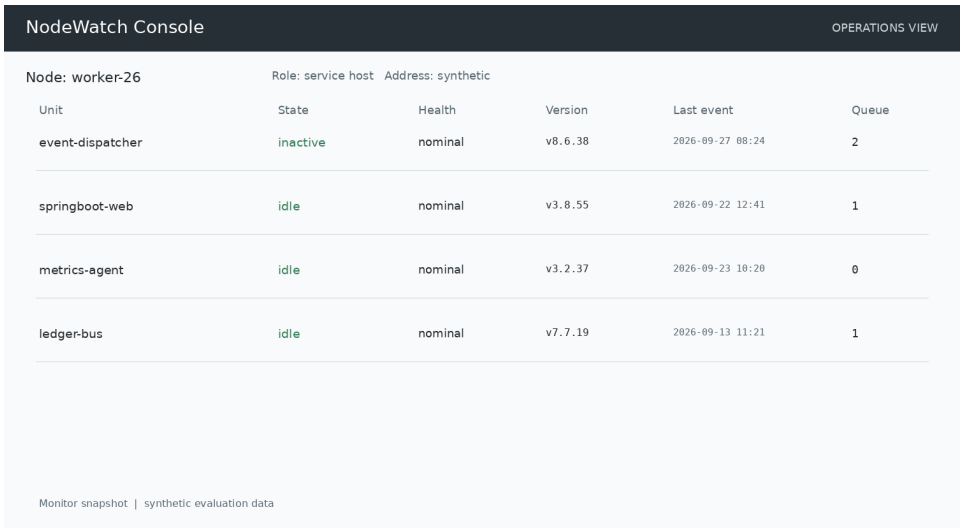

| Step | Action | Result | Duration |
|---|---|---|---|
| 1 | prepare control window | accepted | 00:00:12 |
| 2 | health review | complete | 00:01:14 |
| 3 | record verification | matched | 00:00:08 |

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

## Service health snapshot - worker-26

The monitoring view below provides the supporting health evidence collected after the operational step.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| worker-26 | background worker | 198.51.100.26 | event-dispatcher | health review |

*Evidence capture 2: synthetic dash view for worker-26.*

The monitoring snapshot records a stable node condition with the selected service in the expected state.

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

# Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

## Service start evidence - relay-44

The selected runtime was started as part of the recorded maintenance action; the resulting state is shown below.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| relay-44 | relay worker | 198.51.100.44 | pricing-api | start |

*Evidence capture 1: synthetic start view for relay-44.*

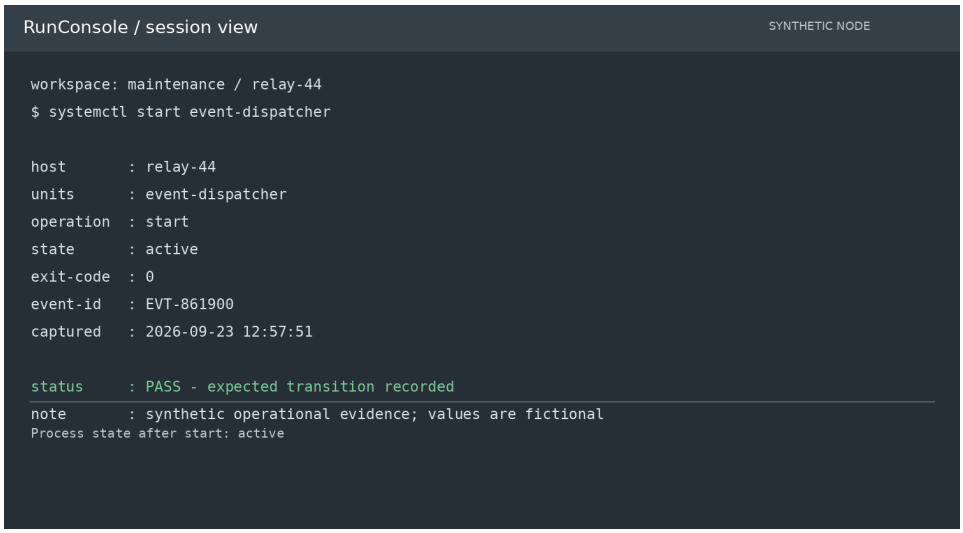

The runtime process is shown in the expected active state after the start action.

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

## Service start evidence - relay-44

The service transition was captured after the selected unit entered the maintenance window.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| relay-44 | relay worker | 198.51.100.44 | event-dispatcher | start |

*Evidence capture 2: synthetic start view for relay-44.*

The runtime process is shown in the expected active state after the start action.

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

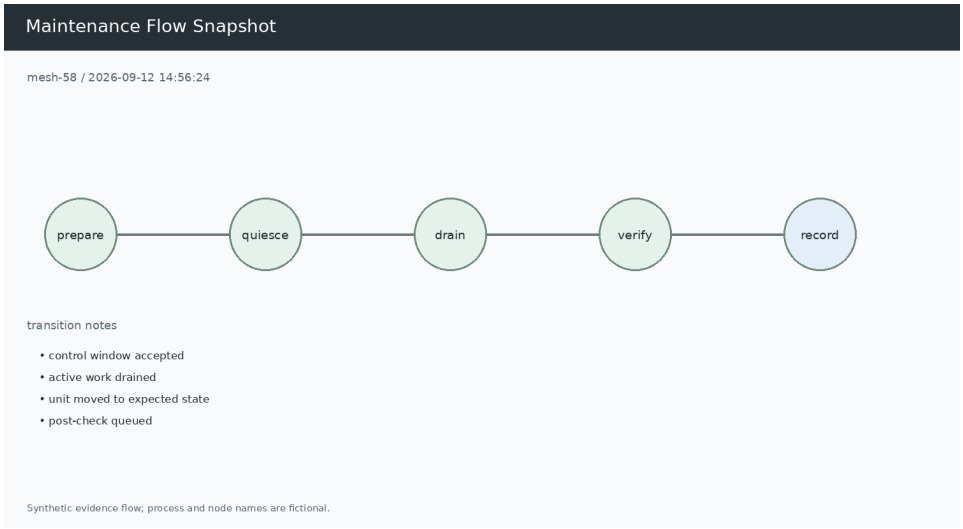

# Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

## Maintenance sequence evidence - mesh-58

The maintenance sequence was captured from preparation through verification and record closure.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| mesh-58 | relay host | 198.51.100.58 | springboot-relay | maintenance flow |

*Evidence capture 1: synthetic flow view for mesh-58.*

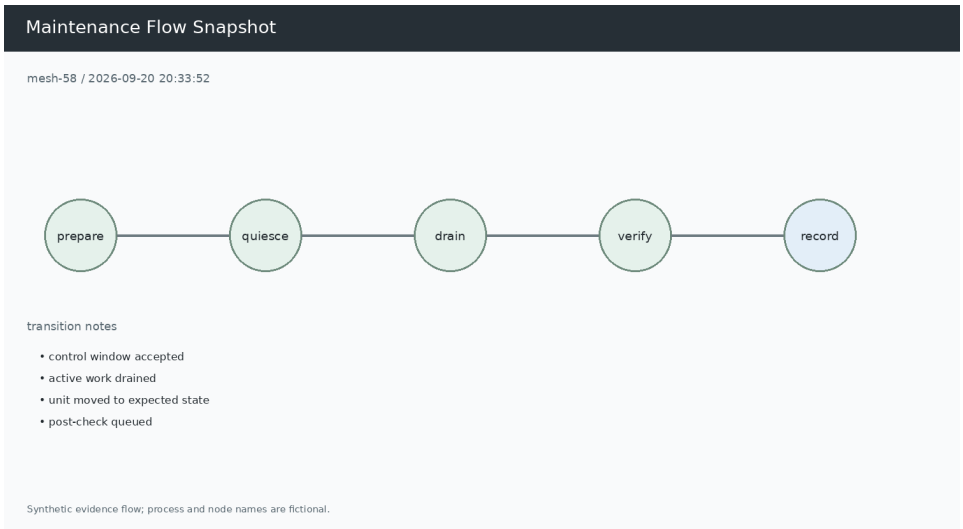

The sequence shows the expected transition and a completed post-action verification.

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

## Maintenance sequence evidence - mesh-58

The evidence below records the ordered control steps used for the selected node during the maintenance window.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| mesh-58 | relay host | 198.51.100.58 | springboot-web | maintenance flow |

*Evidence capture 2: synthetic flow view for mesh-58.*

The sequence shows the expected transition and a completed post-action verification.

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

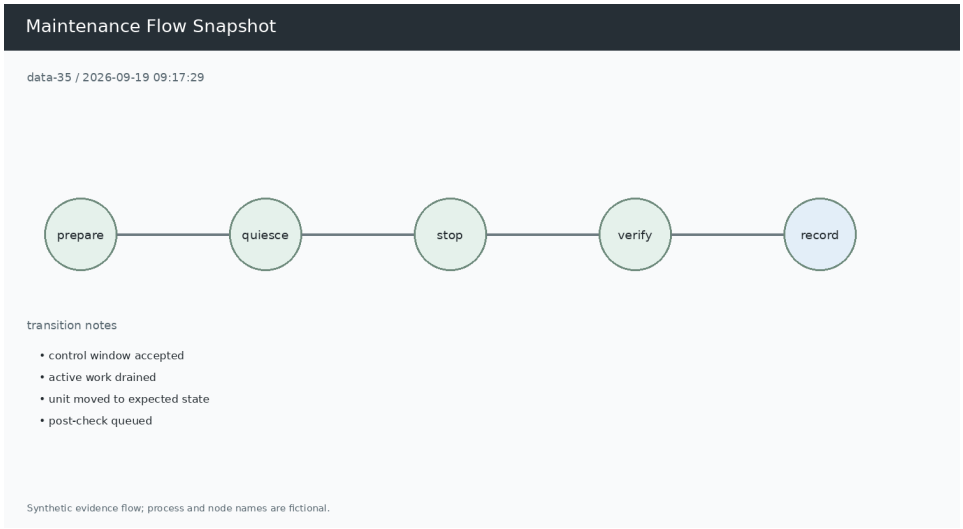

# Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

## Maintenance sequence evidence - data-35

The evidence below records the ordered control steps used for the selected node during the maintenance window.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| data-35 | data worker | 203.0.113.35 | catalog-api | maintenance flow |

*Evidence capture 1: synthetic flow view for data-35.*

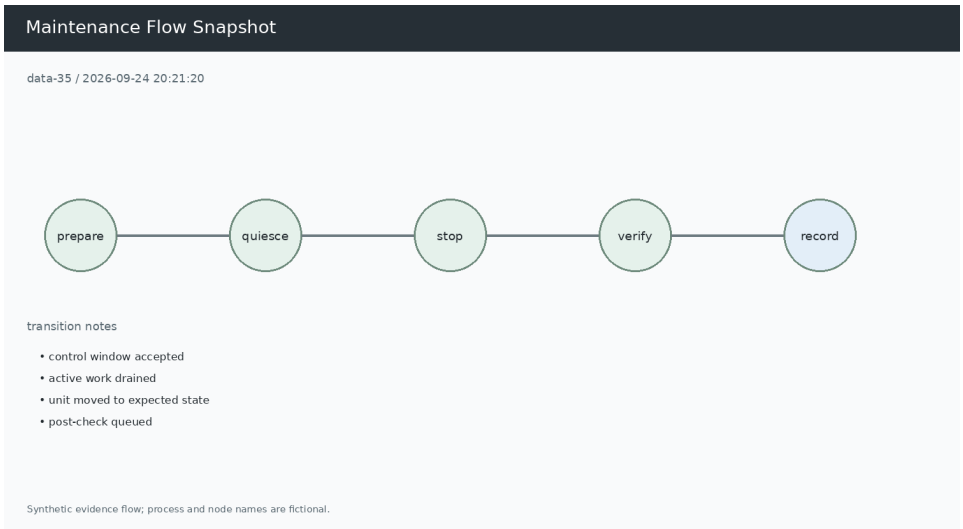

The sequence shows the expected transition and a completed post-action verification.

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

## Maintenance sequence evidence - data-35

The maintenance sequence was captured from preparation through verification and record closure.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| data-35 | data worker | 203.0.113.35 | relay-consumer | maintenance flow |

*Evidence capture 2: synthetic flow view for data-35.*

The sequence shows the expected transition and a completed post-action verification.

| Step | Action | Result | Duration |
|---|---|---|---|
| 1 | prepare control window | accepted | 00:00:12 |
| 2 | maintenance flow | complete | 00:01:14 |
| 3 | record verification | matched | 00:00:08 |

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

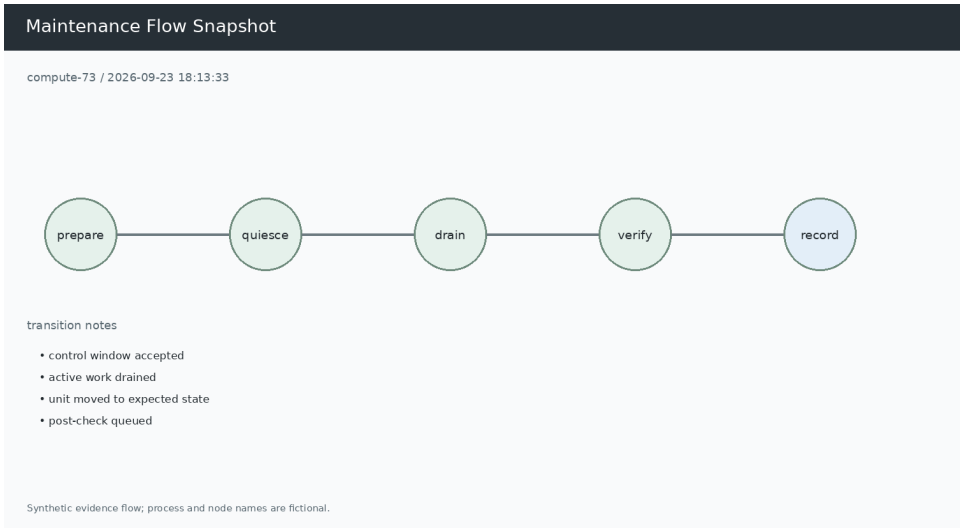

# Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

## Maintenance sequence evidence - compute-73

The maintenance sequence was captured from preparation through verification and record closure.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| compute-73 | compute worker | 192.0.2.73 | springboot-web | maintenance flow |

*Evidence capture 1: synthetic flow view for compute-73.*

The sequence shows the expected transition and a completed post-action verification.

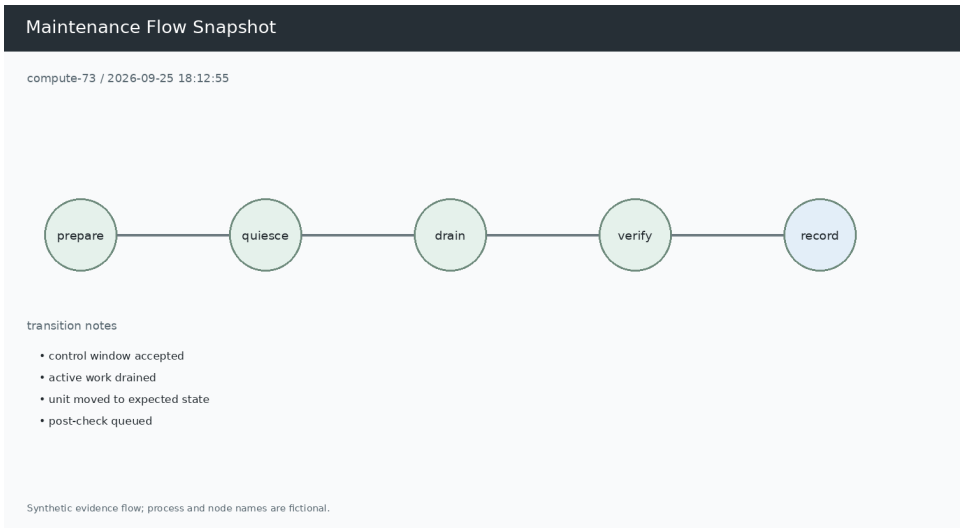

| Step | Action | Result | Duration |
|---|---|---|---|
| 1 | prepare control window | accepted | 00:00:12 |
| 2 | maintenance flow | complete | 00:01:14 |
| 3 | record verification | matched | 00:00:08 |

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

## Maintenance sequence evidence - compute-73

The evidence below records the ordered control steps used for the selected node during the maintenance window.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| compute-73 | compute worker | 192.0.2.73 | springboot-relay | maintenance flow |

*Evidence capture 2: synthetic flow view for compute-73.*

The sequence shows the expected transition and a completed post-action verification.

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

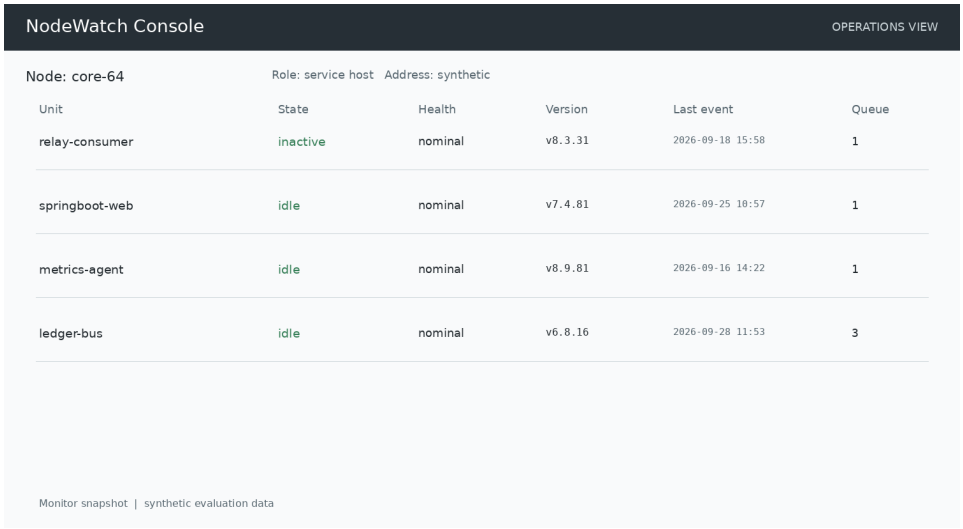

# Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

## Service health snapshot - core-64

The monitoring view below provides the supporting health evidence collected after the operational step.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| core-64 | core service host | 203.0.113.64 | relay-consumer | health review |

*Evidence capture 1: synthetic dash view for core-64.*

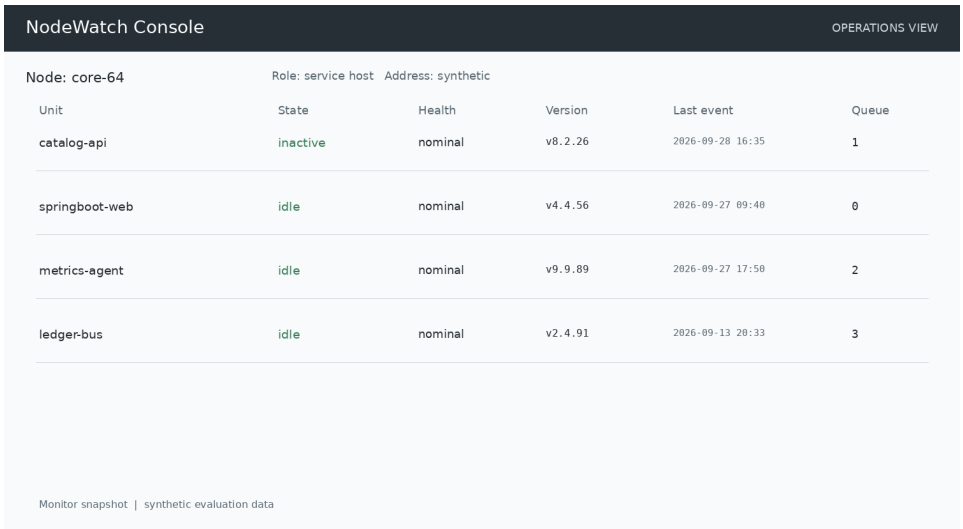

The monitoring snapshot records a stable node condition with the selected service in the expected state.

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

## Service health snapshot - core-64

A post-action monitoring snapshot was captured to compare runtime state, node health, and queue condition.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| core-64 | core service host | 203.0.113.64 | catalog-api | health review |

*Evidence capture 2: synthetic dash view for core-64.*

The monitoring snapshot records a stable node condition with the selected service in the expected state.

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

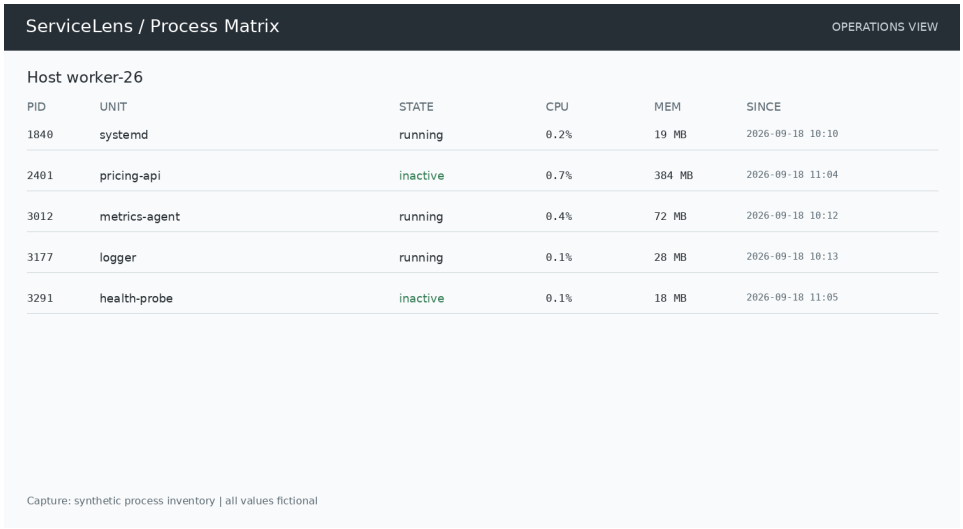

# Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

## Process state verification - worker-26

The selected node was reviewed after the operational step to confirm the state of the relevant process family.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| worker-26 | background worker | 198.51.100.26 | pricing-api | verify process state |

*Evidence capture 1: synthetic proc view for worker-26.*

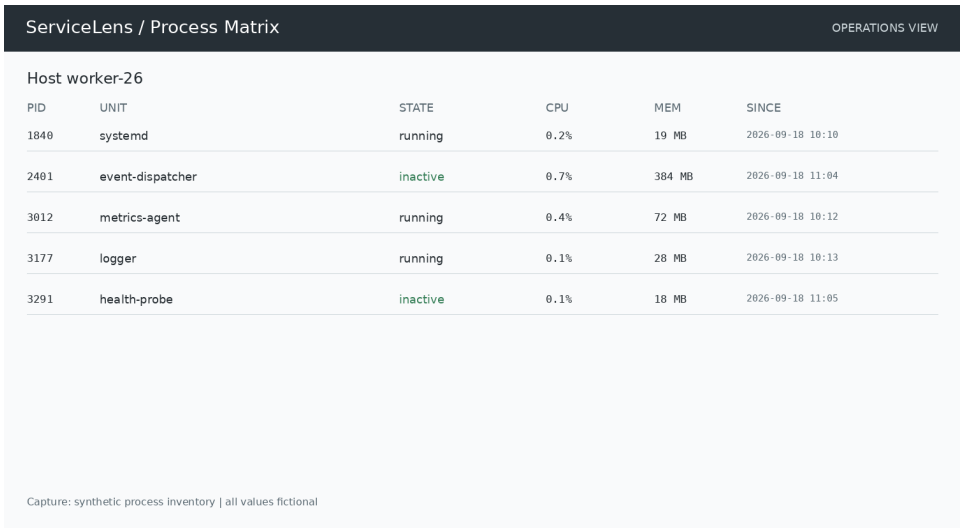

The process matrix confirms the selected service family reached the expected post-action state.

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

## Process state verification - worker-26

A process inventory was captured after the maintenance action to verify that the expected service state was reached.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| worker-26 | background worker | 198.51.100.26 | event-dispatcher | verify process state |

*Evidence capture 2: synthetic proc view for worker-26.*

The process matrix confirms the selected service family reached the expected post-action state.

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

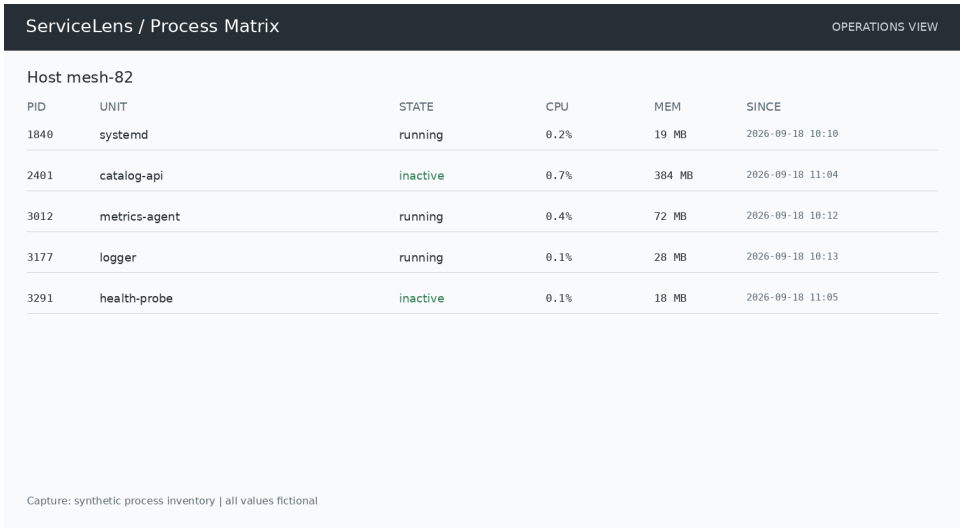

# Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

## Process state verification - mesh-82

A process inventory was captured after the maintenance action to verify that the expected service state was reached.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| mesh-82 | mesh worker | 192.0.2.82 | catalog-api | verify process state |

*Evidence capture 1: synthetic proc view for mesh-82.*

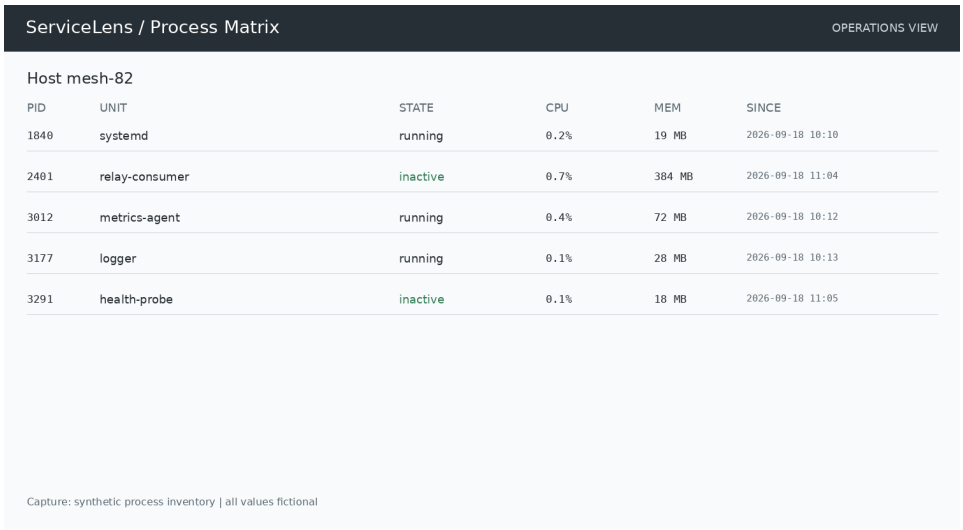

The process matrix confirms the selected service family reached the expected post-action state.

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

## Process state verification - mesh-82

The selected node was reviewed after the operational step to confirm the state of the relevant process family.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| mesh-82 | mesh worker | 192.0.2.82 | relay-consumer | verify process state |

*Evidence capture 2: synthetic proc view for mesh-82.*

The process matrix confirms the selected service family reached the expected post-action state.

| Step | Action | Result | Duration |
|---|---|---|---|
| 1 | prepare control window | accepted | 00:00:12 |
| 2 | verify process state | complete | 00:01:14 |
| 3 | record verification | matched | 00:00:08 |

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

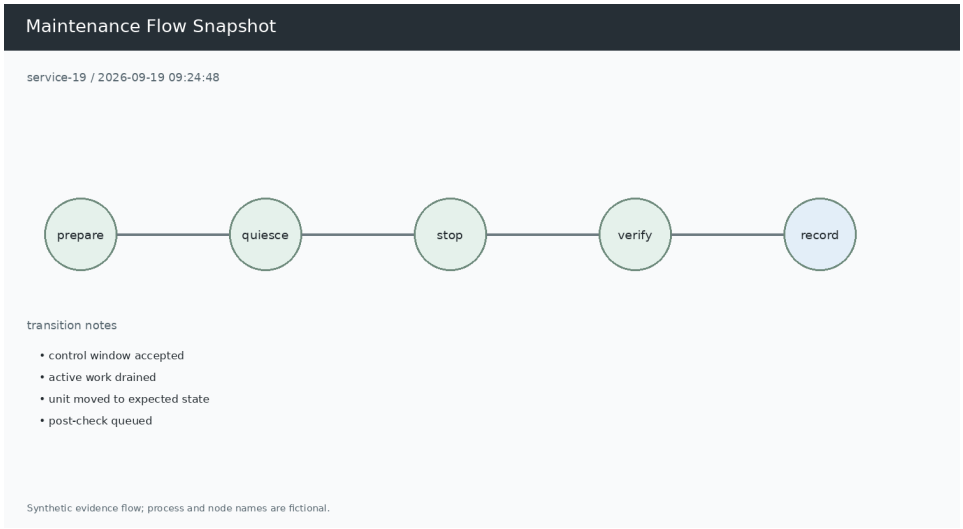

# Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

## Maintenance sequence evidence - service-19

The maintenance sequence was captured from preparation through verification and record closure.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| service-19 | service host | 198.51.100.19 | queue-worker | maintenance flow |

*Evidence capture 1: synthetic flow view for service-19.*

The sequence shows the expected transition and a completed post-action verification.

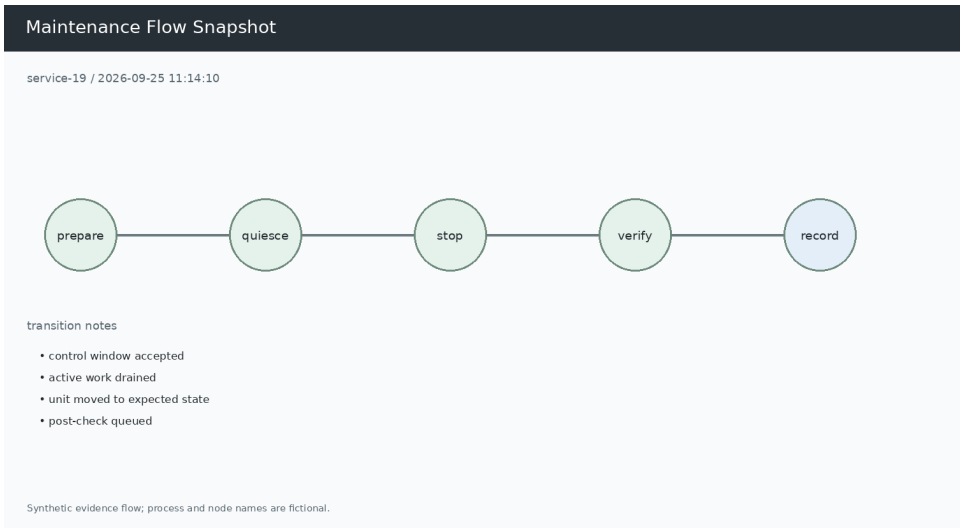

| Step | Action | Result | Duration |
|---|---|---|---|
| 1 | prepare control window | accepted | 00:00:12 |
| 2 | maintenance flow | complete | 00:01:14 |
| 3 | record verification | matched | 00:00:08 |

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

## Maintenance sequence evidence - service-19

The evidence below records the ordered control steps used for the selected node during the maintenance window.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| service-19 | service host | 198.51.100.19 | session-api | maintenance flow |

*Evidence capture 2: synthetic flow view for service-19.*

The sequence shows the expected transition and a completed post-action verification.

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

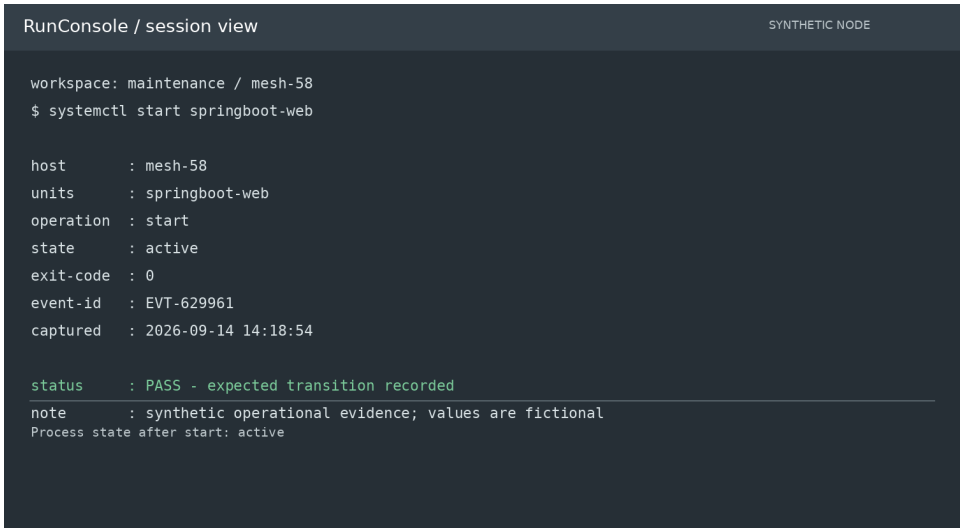

# Synthetic Server Operations - Evidence Record

This page contains independent operational evidence for two server/process streams. The visual format is intentionally shared so classification depends on semantic evidence and relationships rather than page styling.

## Service start evidence - mesh-58

The selected runtime was started as part of the recorded maintenance action; the resulting state is shown below.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| mesh-58 | relay host | 198.51.100.58 | springboot-web | start |

*Evidence capture 1: synthetic start view for mesh-58.*

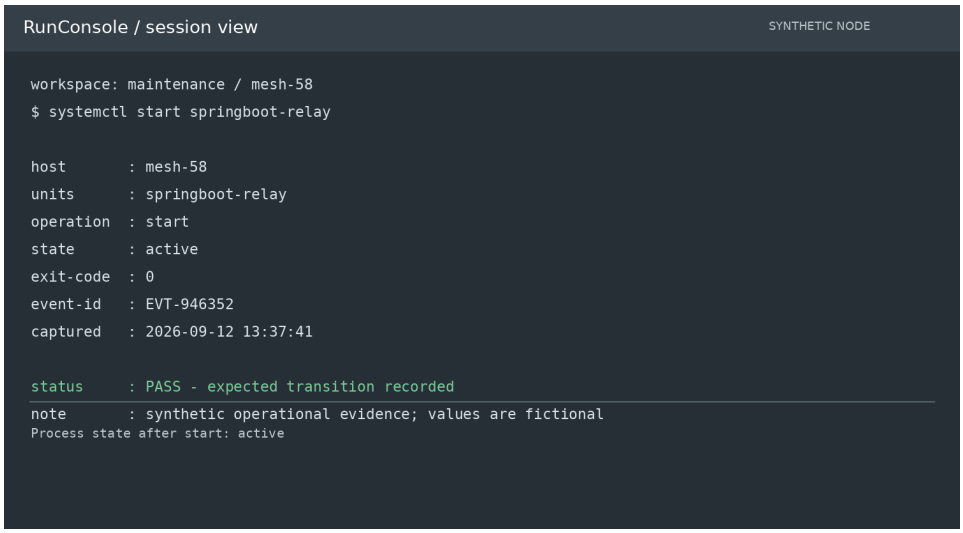

The runtime process is shown in the expected active state after the start action.

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*

## Service start evidence - mesh-58

The service transition was captured after the selected unit entered the maintenance window.

| Server | Role | Address | Service | Operation |
|---|---|---|---|---|
| mesh-58 | relay host | 198.51.100.58 | springboot-relay | start |

*Evidence capture 2: synthetic start view for mesh-58.*

The runtime process is shown in the expected active state after the start action.

*Evidence section closed; subsequent content may refer to the same server or a different maintenance stream.*
